CHAPTER II - METHODS AND FREQUENCIES OF SAMPLING

SECTION 201 GENERAL

It shall be the responsibility of the District Materials Engineer, as representative of the District Administrator, to maintain general supervision over the taking of samples in the field for submission to the Laboratory. The District Materials Engineer is also the field representative of the Materials Division and represents the State Materials Engineer in matters pertaining to sampling. Sampling of materials in the field (from project, plants, or distributors) shall be done only by properly instructed and authorized personnel, as outlined in Sec. 106.02.

When feasible, manufactured material will be sampled as close to the source of manufacture as possible. When beyond State boundaries, this will usually be done by a commercial laboratory representative contacted through the Central Office Materials Section. Materials composed of several different tested items, will be tested after the materials are combined and before final incorporation into the job.

When Construction Inspectors are authorized to take samples, the responsibility of the District Administrators, Residency Administrators, Area Construction Engineers, and District Materials Engineers shall not be relieved.

For a test to be valid the sample must be as nearly representative of the material as possible. Material is to be sampled by an employee or an official representative of the Department of Transportation when such samples are to be tested as a basis for acceptance or rejection of the supply.

The sampler must be aware that some materials segregate and, therefore, the sample unless properly taken could give a false impression of the whole. Samples are taken randomly in a preconceived method to reduce bias, either intentional or unintentional on the part of the sampler.

There are a number of ways the randomness may be accomplished. Such details are contained in other instructions issued by the Materials Division, in the Virginia Test Methods Manual or Study Guides for the appropriate material.

The sample for materials that tend to segregate easily, such as aggregates, should be of sufficient size that the laboratory may reduce the material to testing size by one of the methods outlined in AASHTO T248.

In other sections, the sample size is specified as the cube root method, which is simply the cube root of the number of units considered in the entire lot.

Samples for new products or innovations may be submitted by the Producer or Manufacturer of the product, but the materials represented by such samples must be resampled and tested by an authorized employee or representative of the Department, and approved, before the material may be accepted in highway construction or maintenance.

It is important to note that the frequencies for sampling outlined herein are the minimums required for materials acceptance. The Department has the prerogative of taking more samples, should the need be so indicated by questionable or suspect material or test results.

Quite often it is important to increase the frequency of sampling when a production plant initially begins and to decrease as the product approaches an even characteristic. Increased frequency may also be warranted if the source is a new one to the Department, at least, until such time as the quality control of the product is proven.

It should also be noted that, unless shown otherwise, the frequencies and locations for sampling apply primarily to source sampling. If it is necessary to perform sampling of material at the project site, this will usually be at a lesser frequency than source sampling. See Sec 205 for the normal sampling location.
SECTION 202 DEFINITION OF SAMPLES

In order to properly identify the various types of samples, and in order that the Materials Division may properly distribute the test results to the field, it will be necessary that samples be designated as outlined in the following sections.

Sec. 202.01 Investigation Samples

Investigation samples are those taken by any properly trained representative of the Materials Division, and used for approval of new products, approval of new sources of supply, or for information of the Contractor. Any pertinent information regarding the sample should be recorded on the proper form accompanying the sample to the Laboratory, in order that the material under investigation can be readily tested and identified for future use.

Sec. 202.02 General Samples

General samples are those usually representing large quantities of materials in stock at a Producer's location. These samples ordinarily will be submitted for test by representatives of the Department. After the material is approved for use by the Materials Division, it will later be released from stock to various specific projects in specified amounts. The sum total of all the individual amounts released to different projects should never exceed the total amount originally reported in stock as being tested and approved on any one general report.

Sec. 202.03 Acceptance Samples

Acceptance samples are those submitted for test during the normal course of construction or maintenance and are used for purposes of routine acceptance or nonacceptance. These samples constitute the principle means of determining, prior to or at the time of the construction or maintenance operations, whether the materials and workmanship are satisfactory or whether corrective action should be taken before the work proceeds. Under ordinary conditions, this will be the type sample most commonly used.

Only properly instructed and trained Department representatives may take this sample. Acceptance samples will normally represent material being used on specific projects, and should be identified with the correct project and section numbers when submitted to the Laboratory for testing. Acceptance samples should be taken in such quantities and at such times as specified in the various sections of this Manual, in specifications, in special provisions, or in letters of instruction from the Engineer, in order to sufficiently maintain proper and normal sampling and acceptance.

These samples and tests are made to determine on a regular basis whether the quality of the materials being used or proposed for use in the construction and maintenance and the quality of the work being produced are in reasonably close conformity with the plans and specifications.

Acceptance samples are described as being of one of the following 5 types:

(1) Samples of material taken and tested at the site by project personnel. Project personnel will make routine test reports and distribution of these reports, as outlined in other sections of the Manual or instructional memoranda. An example of this would be a soil density test, which would be reported on Form TL-125, etc.

(2) Samples of materials on work taken at the site by project or laboratory personnel and tested at the District or Central Laboratory, with test results obtained for each of the required tests being reported to the project personnel, as outlined in other sections of the Manual or instructional memoranda. This report may be in the form of numerical test results or in the form of an inspection and release report. An example of this sample would be a concrete cylinder, which would be reported on Form TL-26 (TL-26A and B for computer input and output respectively).

(3) Samples of materials taken by District or Central Office Laboratory personnel at the production or processing plant, shipping point, or other source of origin remote from the project and tested at the District or Central Office Laboratory, with test results obtained for each of the required tests being reported to the project personnel, as outlined in other sections of the Manual or instructional memoranda. This report either may be in the form of numerical test results or in the form of an inspection and release report. An example of this type
would be epoxy, which would be reported on Form TL-109, with the numerical test results kept on file in the laboratory on Form TL-30.

(4) Samples of Asphalt Mixtures and Central-Mixed, Dense Graded Aggregates will be taken by the Contractor under the Quality Assurance Program and the Department will perform independent assurance sampling and Quality Assurance testing checks to verify the accuracy of the Contractor's testing program. The Contractor will furnish the test results to the Department on forms furnished by the Department. The routing of the reports will be handled as outlined in other sections of this Manual.

(5) Samples of manufactured materials taken and tested by the Manufacturer or Supplier and accepted by the Department on Mill Analysis, test report, or certification. An example of this type would be hydraulic cement or guardrail.

For frequency of acceptance sampling and testing, see Sec. 205 and other sections covering each individual material.

In the event certain acceptance samples fail, the material represented by the failing sample(s) will be subject to a price adjustment or removal from the road. This applies primarily to such materials as asphalt mixtures and central-mixed aggregate base and subbase materials.

**Sec. 202.04 Independent Assurance Samples**

Independent Assurance Samples are samples tested to verify the quality of testing that is used for acceptance of materials. The IAS program covers both project related testing, such as depth, density, slump, air, compressive strength, and plant produced materials on quality control/quality assurance programs.

See Section 206 for details on testing frequencies for project site testing. See Section 311.05 and 502.04 for details on testing frequencies for plant produced materials.

See Sec. 202.06 for details of certifying I.A. sampling and testing to FHWA at the completion of each project for project related testing.

**Sec. 202.05 New Products**

New Products or methods are constantly being brought to the attention of the Department Engineers. These are products which are not covered by current specifications.

When this occurs, the vendor should complete a "New Products" questionnaire available from any Materials office. The instructions thereon are evident.

The New Products Committee will then consider the product and take appropriate action. This action may be in the form of complete acceptance, complete rejection, request for further information, referral for advice to another Division, or a decision to place a trial field installation.

Once a new product has been accepted by the New Products Committee for field evaluation, the District Representative is to assist the Committee by selecting sites for field evaluation; by arranging for installation using Residency forces or as an addition to a current contract; by observing the installation; by making periodic on-site inspections, and reporting observations; and by making recommendations concerning further use.

**Preparation**

1. When called upon to assist in coordinating and expediting the process of getting a new product installed and evaluated, the District Representative should review all pertinent literature available, brief the Area Construction Engineer and establish contact with the Manufacturer's representative requesting his/her presence at the time the product is placed.

2. Determine exactly what the product is supposed to do and then establish the kinds of tests and observations which will verify or disprove the Manufacturer's claims concerning the product. Seek assistance of the Materials Division and/or Research Council in designing the evaluation program.
(3) Decide upon the factors which will affect performance, such as temperature and moisture.

(b) **Design of Field Installation**

(1) Decide upon the more important and achievable goals for the field installation. In other words, what are the performance characteristics we hope to evaluate?

(2) Decide upon the number and size of the "test sections" and "control sections". The test section is the section in which the product is placed, and control section is the section without the product and to which performance is to be compared. It is important to place test sections and control sections under as similar conditions as possible where the only significant variable is the product itself.

(3) Decide upon the test site. Place the test section and control section as close together as possible, but separate the two sufficiently to avoid contamination. Consider the influence of such factors as geometrics, soil conditions, drainage, shaded areas, use of de-icing chemicals, traffic volume and type, etc.

(4) Decide upon the sampling, testing, and observation programs that will be followed, especially frequency and duration. The use of statistical analysis is encouraged wherein an appropriate number of samples are obtained in a randomized sampling plan.

(c) **Installation**

(1) Where practicable, schedule installation for the conditions recommended by the Manufacturer.

(2) Arrange for the Manufacturer's representative to be present during installation.

(3) Follow Manufacturer's recommendations for installation as closely as possible. Document the procedures followed and especially any deviation from the Manufacturer's published recommendations.

(4) Record field conditions, time frames, delays, construction practices and equipment used, worker's skills, and any failure noted during installation.

(5) Take photographs of the critical phases of the installation.

(d) **Reporting**

(1) Prepare a report of observations and tests conducted at the time of installation and at the time of each subsequent visit made to monitor performance.

(2) Use the Field Performance Evaluation forms shown in Sec. 800, where applicable, and submit the information called for thereon where appropriate. Attach copies of test reports and photographs taken.

(3) Forward reports to the Chairman of the New Products Committee for distribution to the Committee. Be sure to include appropriate recommendations regarding the products.

**Sec. 202.06 Materials Notebook Submittal**

At the completion of each project, the District Material Engineer will include a statement at the end of the materials notebook to be submitted to the District Administrator certifying that the required number of acceptance and I.A. samples have been taken on the project and that the acceptance sample test results indicate that all of the materials used on the project were in reasonably close conformity with pertinent approved plans and specification requirements. The statement should further certify that the test results of acceptance samples compare favorably with those of I.A. samples and tests. Any exceptions to the above statements should be noted. Certification to the F.H.W.A. of materials acceptance will be made by the District Administrator on Form TL-131, as outlined in Sec. 800. Materials notebooks will be audited by the Central Office at random in the District Materials Office.

**Sec. 202.07 Materials Project Records Retention**

With concurrence of the District Contract Administrator the District Materials Engineer’s project records shall be kept on file for 5 years after close of project and then destroyed with the exception of Soil survey reports, supplemental soil survey reports (pavement design revisions, special slope reports, special foundation reports,
etc.), pipe foundation reports and minor structure foundation reports. These records shall be submitted to the Administrative Services Division’s Main File Room for microfilming. Three copies of the microfilm will be made, one copy to be forwarded to the Central Office Materials Division, and one copy to be retained by Administrative Services Division’s Main File Room, one copy to be returned to the District Materials Section. The project records may be stored for the five years retention period as on site paper documents, off site paper documents, or as microfilm or electronic format documents as desired by each District Materials Engineer.

SECTION 203 SUBMISSION OF SAMPLES

The submission of samples to the Materials Division for tests shall be in accordance with the instructions given for each type of material. If there is any doubt about the proper procedure to follow, the District Materials Engineer or the Materials Division should be contacted for instructions. Any material that is toxic or flammable should be plainly marked, so that in cases of accident, doubt will not exist with regard to handling. The table shown in Sec. 205 briefly summarizes the requirement for the proper size of sample, the container, and necessary packing when submitting samples to the Materials Division. More detailed instructions are given for specific materials in the following sections.

Sec. 203.01 Packing of Samples

It is essential that the proper type of container be used for submitting samples that require a container. All liquid materials must be shipped in tight containers and packed in sufficient absorbent material such as sawdust, excelsior, etc., to prevent leakage from the package. Samples of water must be shipped in glass or plastic containers. Samples of asphalt emulsions must be shipped in glass or plastic containers with tops that have non-metallic liners. In addition, any liquid asphalt material must also have the container secured in a plastic bag and tied to prevent leakage. All other liquids must be shipped in metal cans with lids securely fastened to prevent leakage. Locking clips to hold tops firmly in place should be used. All such packages must be marked “Liquid” and “Handle with Care”. In case of glass containers, the package must be marked “Fragile” and “Glass”. Mail sacks are not to be used for shipping samples of liquid, flammable, or toxic chemicals, as this can lead to the sample accidentally spilling onto the handler or other mail. When samples of other materials are shipped in cloth bags, the bags must be securely fastened with cord or wire bag ties. Wire shall not be used for fastening these bags, unless the wire can be mechanically applied and no cut ends are left exposed. Holes shall not be cut in canvas bags for the purpose of tying the tops.

Sec. 203.02 Material Safety Data Sheet

When submitting samples of materials to the Laboratory for test, it is necessary to submit with the sample a Material Safety Data Sheet (MSDS) for any material that requires such. Samples of such material will not be processed unless the MSDS accompanies the sample.

Sec. 203.03 Identification of Samples

Samples must be identified as described in the following paragraphs:

(a) Complete Information Concerning Sample

Complete information must be submitted with each sample. Forms TL-10, TL-11 and TL-13 have been furnished for this purpose. Duplicate copies of the proper form for each sample shall be completed as shown in Sec. 800.

(b) Proper Manner of Tagging Samples

A tag envelope, Form TL-3, containing a copy of the proper notification card, must always be fastened to the OUTSIDE OF THE PACKAGE. Form TL-3 should be addressed to the attention of the particular lab or person to which or to whom the sample or item is being sent. The envelope must not be used for any other purpose. Always place the gummed portion on the outside of the envelope. Placing it inside may cause it to stick to the sample card and obliterate the data thereon. If the sample is forwarded by parcel post, it will be necessary for the shipper to place the required postage stamp on the tag envelope in addition to the postage on the package.

(c) Duplicate Card

Mail duplicate TL card.
**Sec. 203.04 Shipment of Samples**

Considerable economies can be affected in the transportation of samples by following the practices outlined in this section.

The fullest possible use of State cars and trucks should be made in moving samples. When Engineers are visiting a project or plant, samples should be picked up and carried to the Laboratory designated to conduct the test, or, when this is not practical, the samples should be carried to some central shipping point.

When samples are to be sent by common carrier, separate packages should be grouped to make a composite shipment and sent by the best means available. No general rule can be made as to the best means.

**SECTION 204 SAMPLING MATERIALS**

**Sec. 204.01 Admixtures, Concrete**

(Sec. 215) Concrete admixtures normally will not be sampled by the Department. These admixtures instead are approved on an annual list, which is available on the Materials Division website. Manufacturers will certify annually (by mid-December) that their product has not changed in any respect since the original submission. Some admixtures are not compatible with others nor with changes in cement or aggregates. Caution should be exercised and trial mixes are suggested before using new admixtures or changing any ingredient in a mix which has good performance history. This initial approval is gained by submission of independent laboratory test data indicating compliance with the specification. The Central Laboratory will review the submitted test data and determine if the admixture meets specification. If the determination is that the admixture is acceptable for VDOT use, the product will be included on the appropriate Approved List for concrete chemical admixtures. See Sec. 207 for modified acceptance procedure.

Compatibility of water reducing and retarder admixtures with other materials is of vital interest to the contractor and supplier because of the significant changes which can occur in placement and finishing time. Hence, changes in either the composition of materials or the sources of supply, especially admixtures or cement, should, evoke laboratory or field trial work on the part of the contractor or his concrete supplier.

**Sec. 204.02 Aggregates**

(Secs. 201 through 207 and Chapter 7) The minimum requirements for Independent Assurance samples of aggregates shall be in accordance with Sec. 206. See Sec. 207 for aggregates that may be approved by modified procedure. The following instructions will generally cover acceptance sampling and testing of aggregates.

(a) Sampling at New Sources

In order to avoid any semblance of encroaching in the field of commercial testing laboratories, the testing of aggregate for private interests will be avoided. This policy applies to other materials as well, but primarily applies to noncommercial local deposits. The following basic rules will help to alleviate this condition, and should be followed explicitly in the testing program.

1. Samples submitted for investigation tests from new non-commercial sources are to be obtained by a qualified representative of the Department. If at all possible, the aid of a Geologist should be used in order to obtain the fullest information possible.

2. Samples are not to be taken and submitted until adequate exploration of the area has been made, that will permit a reasonable evaluation of quantity and uniformity of the deposit to justify sampling and testing.

3. Complete identification information as to the source, property owner, quantity, etc., must be submitted with each sample.
(4) Test results will be sent to the State Materials Engineer for distribution, and if sample is approved for specific uses, the submission of such sample implies it can be made available to any and all Contractors who may be interested in its use in Department work.

(5) Samples must be submitted for test sufficiently far in advance of their anticipated use to permit completion of the necessary tests. This will permit the making available of positive advice, at time of project showings of its availability.

(6) Instructions for proper sampling are given in the following sections concerning each of the individual materials.

(1) Stone from Local Ledges and Potential Quarries for Quality

Samples of this material shall generally be taken in accordance with AASHTO T2, except as modified herein.

For the standard quality test, at least 75 lbs. (35 kg) of crushed stone graded from 3/4 in. (19 mm) to 3/8 in. (9.5 mm) shall be submitted to the Central Office or District Laboratory from each layer or ledge that appears different in color or structure. Where it is impossible to obtain crushed stone, or when there are no available means of crushing the sample, 150 lbs. (75 kg) of fresh unweathered material shall be submitted to the Central Office or District Laboratory from each layer or ledge.

All samples shall be packed and marked, in accordance with Sec. 203, using Form TL-11, as outlined in Sec. 800. Special care shall be taken to ship the aggregate in a secure container or sample bag free of contaminants.

(2) Sand and Gravel from Potential Deposits

Samples of this material shall generally be taken in accordance with AASHTO T2, except as modified herein. Potential as used here includes all undeveloped sand and gravel deposits and all developed deposits where the material is not washed or screened.

Samples of material, in which the sand and gravel are combined, shall consist of such a total weight that, on separation, the sample shall yield at least 40 lbs. (20 kg) of the lesser constituent.

All samples shall be packed and marked, in accordance with Sec. 203, using Form TL-11, as outlined in Sec. 800. Special care shall be taken to ship the aggregate in secure containers or sample bags free of contaminants. Samples containing fine sizes shall be shipped in a tight container or closely woven bag.

(b) Sampling at Established Sources

Common courtesy dictates that the Department representative always announce his presence to a company representative. In addition, Mine Safety and Health Administration Regulations require each plant to have explicit safety rules that may not be waived. Usually, this means visits to the pit or quarry face must include accompaniment by an aggregate producer’s designated official. These company safety rules must be strictly followed and violation by Department employees could result in administrative action.

The source of aggregates must be reapproved in accordance with the timeframes set forth in the appropriate tables below by the Materials Division/Section for quality or at any other such time that the material quality appears to have changed as deemed necessary by the Department. Sampling for quality will be performed by the District Materials Engineer. (See lists in Sec. 209.)

The District monitoring the aggregate source will determine the sampling frequency needed and coordinate the sampling schedule with the Regional or contract testing laboratory. Alternatively, the monitoring District may request that the Regional Lab develop the sampling schedule.
Note that the frequency of testing is determined by using the latest (historical or previous) tested value with the appropriate specification (spec) limit.

If sufficient testing data exists on a given aggregate quality property, the following methodology may be used to determine the frequency of test.

1. Compute the standard deviation using the tested values.
2. Develop a frequency of testing chart using the following criteria:

   \[
   \begin{align*}
   SL &= \text{Specification Limit} \\
   SD &= \text{one Standard Deviation} \\
   A &= [SL - (SD \times SL)] \\
   C &= [A - (SD \times A)] \\
   E &= [C - (SD \times C)] \\
   G &= [E - (SD \times E)]
   \end{align*}
   \]

   Round \( A, C, E \) and \( G \) to the nearest tenth, then

   \[
   \begin{align*}
   B &= A - 0.1 \\
   D &= C - 0.1 \\
   F &= E - 0.1 \\
   H &= G - 0.1
   \end{align*}
   \]

   0 to \( H \) = 5 years
   G to F = 4 years
   E to D = 3 years
   C to B = 2 years
   A to SL = 1 year

Otherwise, the charts below are used to determine testing frequency. The charts are based upon the \( d_2s \) value for the test method. To develop a chart, a standard deviation was approximated from the \( d_2s \) value. The method documented above was used to generate the chart. Numbers generated for the chart were adjusted to facilitate ease of use.

In addition to source approval sampling performed by the Department, the Producer shall sample and test aggregates for size before shipping to the job site, in accordance with the frequencies outlined in Paragraph (b)(1) herein. See Secs. 109, 110, and 800 and Paragraph (d) herein for additional duties of Weighpersons, instructions for aggregate certifications and use of Form TL-102A.

(1) Modified Acceptance Plan for Fine, Coarse Open-Graded and Crusher Run Aggregates

Aggregate Producers shall be responsible for controlling their product for gradation and Atterberg Limits, in accordance with the plan outlined herein, when producing any type aggregate, other than Type I Select Material or any type subbase or base dense-graded, central-mixed aggregates specified respectively in Secs. 207 and 208 of the Road and Bridge Specifications. Approval of the Producer's Quality Control (QC) Plan shall in no way relieve the Producer or Contractor of responsibility for complying with all of the requirements of the contract or specifications. The QC Plan shall meet the following specific requirements.

Test and Equipment: Test procedures shall be conducted in accordance with the standards referenced in the current specifications. Testing for gradation and Atterberg Limits (where required) will be conducted on the Department's verification samples. Only the gradation test is necessary on the Producer's QC samples, unless a known problem exists. To accommodate the testing requirements, a field or plant laboratory shall be furnished and shall contain the following equipment:

1 - Motorized screen shaker for fine and coarse aggregate grading analysis.

1 - Set of sieves for the motorized shaker. The screen sizes shall include the specification sizes for the type of material being produced.
1 - Balance having a capacity of at least 45 lbs. (20 kg), with a sensitivity of one ounce (28 grams) or less.

1 - Balance having a capacity of at least 2.5 lbs. (1 kg), with a sensitivity of 0.1 gram or less.

1 - Drying apparatus.

1 - Set of liquid and plastic limit devices.

Producers shipping only f-coarse open-graded aggregate shall not be required to obtain Atterberg Limit equipment.

**Sampling Rate:** The QC sampling rate shall be one (1) sample per 1000 tons per size of material produced. It is recognized that due to production schedules, past performance and perhaps other factors, this rate may be changed for a particular operation. Therefore, the actual rate for a specific location shall be at the discretion of the District Materials Engineer.

**Sampling Method:** With the requirements of quality assurance and Producer certification of aggregate, the method of obtaining aggregate samples for grading tests becomes more critical. Therefore, the only way statistics will be meaningful is for the sampling, by both the Department and the Producer, to be performed in a similar manner.

Samples shall be obtained from each size material produced. These samples shall be selected from barges, conveyor belts, stockpiles or as approved by the Engineer. Sampling and testing shall be performed by qualified personnel.

Sampling of aggregate shall follow the procedures outlined in AASHTO T2 as modified herein. The shovel used for sampling of aggregates shall be a square nose shovel of spade design with slightly built up edges and back, capable of penetrating full depth into the stockpile. A short handle with butt handle grip is needed to obtain the leverage to remove the sample from the stockpile. The sample size should be as outlined in Paragraph (b)(2) herein.

For source approval sampling, segregation of the individual particles is not important, for they will be recombined into the testing sizes needed in the laboratory. Therefore, for coarse aggregate, a sample of approximately 40 lbs. (20 kg) each of No. 8 and No. 57, if available, will generally be sufficient to conduct quality tests. For fine aggregate, a single 40 lbs. (20 kg) sample is sufficient.

To determine gradation compliance, the sampler shall take care to follow the procedures outlined in Paragraph (b) (1) above exactly. When safe to do so, samples shall be taken at a point other than in stockpiles to reduce the error inherent with stockpile segregation. A sample of approximately 10 lbs. (5 kg) is typically sufficient for fine aggregate and one of 30 lbs. (15 kg) for coarse aggregate. Open-graded aggregates and Grading A fine aggregate shall be tested for minus 200 material by washing prior to the dry gradation being performed.

All verification samples shall be packed and marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800. Special care shall be taken to ship the aggregate in a secure container or sample bag free of contaminants.

Five (5) types of sampling are permitted as follows:

1. **Truck Bed Sampling:** For details of this type of sampling, see the Central-Mix Aggregate Quality Assurance Program (Certification Study Guide).

2. **Belt Sampling:** At the request of the Producer, belt sampling may be used. A belt sample shall be a composite of three (3) separately selected samples. It is recommended that each of these samples shall be taken between two (2) templates inserted through the material to isolate the sample area, or
by other means which will isolate the sample area on the belt, and all of the material within the sample area shall be collected. The quantity of material contained within the sample area shall be approximately 1/3 of the quantity required for the sample.

(3) Stockpile Sampling: The sample shall be made up of at least six (6) shovelfuls of material secured at approximately equal spacing around the stockpile at approximately the third points of the height of the stockpile. (See instructions above on the proper shovel use.) The area to be sampled shall be opened up to expose the interior material. The shovel should be inserted nearly perpendicular to the face of the exposed material, full depth of the shovel, and raised vertically to prevent segregation. Opening up of the face may be accomplished with the use of a front end loader.

(4) Miniature Stockpile Sampling: The Producer may build a miniature stockpile using a front end loader. The material sampled will then be spread and mixed by the loader bucket and the samples taken from three (3) points within the miniature stockpile.

(5) Sample Tube Sampling: A sampling tube may be used in sampling aggregate sizes smaller than the No. 10 size, and all fine aggregates. The sample tube should be 2 in. (50 mm) minimum diameter by 3 ft. (900 mm) minimum length. Samples shall be obtained from five (5) different locations of the stockpile and the various samples combined to form one (1) composite sample.

The importance of sampling is equivalent to the importance of good quality control. The primary concern of sampling is to take samples that will represent the stockpile as closely as possible and that will determine as accurately as practical the properties of the complete stockpile.

Acceptance of Materials: Materials which fail to meet the specification requirements shall not be shipped to State projects nor for State uses under any circumstances.

All materials meeting the applicable specification requirements may be shipped and accepted based on the Producer's certification, which, among other things, shall state that the required tests by the Producer have been performed and have met the specification requirements of the material. See Paragraph (c) herein and Road and Bridge Specifications Section 200.04 for additional details of the certification.

The Producer shall furnish to the Department a copy of the test results for each size material produced. See Paragraph (f) below for format requirements.

The Producer shall keep all records pertinent to the production for a period of one (1) year, and they shall be available for review by the Engineer.

Verification: The Department through the District Materials Engineer will visually inspect stockpiles of produced materials. When deemed necessary by the Department, verification testing may be performed to verify the adequacy and accuracy of the Producer's quality control plan. When requested by the Materials Representative, samples shall be taken by the Producer in the presence of the Materials Representative, and then either quartered or introduced through a sample splitter, with each party conducting the test on their half. Verification tests shall be conducted in the VDOT Laboratory or by AMRL-accredited consultant laboratories. The verification test results shall be compared to the Producer's test results.

The verification test results shall in no way be used to judge acceptance. The Producer's half of the verification sample may serve as its production sample for that 1000-ton lot. If the comparisons indicate verification test results are not in relatively close agreement with the Contractor's results, an investigation shall be made to determine the reason for the difference. In the event it is determined that the Contractor's test results are not representative of the product, the Contractor shall take corrective action to alleviate any problems identified. If corrective action is not performed in a timely manner or does not alleviate problems identified, the Department may withdraw approval of the Producer’s QC Plan.
General: The Producer's quality control plan shall include a system by which the District Materials Engineer shall be advised as to the amount and size of material shipped to each project or order. If the Producer's quality control plan is found to be unsatisfactory, the Department may withdraw approval of the source.

(2) Dense Graded Aggregates
This material shall be accepted under a statistical, system-based quality assurance program where the Producer samples the material for grading, Atterberg limits, cement content and water content, as applicable. The Producer shall sample in accordance with the Department's current Quality Assurance Program. See Section 300 herein and Road and Bridge Specifications Sections 207 and 208.

(3) Dry Riprap
Contractors shall furnish and place the class of dry riprap specified on the plans. Although dry riprap is primarily mechanically sized during production as other aggregates are, the acceptance of riprap relies primarily on visual inspection for size and percentages to meet the Departments Specifications. Thus to avoid project delays and minimize material rejections the Project Inspector is to use the following procedures:

Stockpiled Dry Riprap - Verify the size and acceptability of the material at the quarry prior to shipment.

Dry Riprap to be shipped as it is produced - Establish by visual inspection with the Contractor and the Producer the size and percentages required to meet the Department's Specifications.

The Contractor shall furnish samples of the minimum and maximum size riprap at the project site to be used for visual comparison of riprap delivered to the project and a sample should be maintained at the quarry for the Producers benefit. In the event a shipment is questionable as to specification conformance, the District Materials Engineer shall make the final determination as to acceptability.

(4) Sizes No. 1, No. 2, No. 3, and Gabion Stone
Except for use in hydraulic cement concrete, aggregate size No. 1, No. 2, No. 3 and Gabion Stone shall be inspected visually for size, cleanliness and general conformance to the specified gradation. Gradation testing shall be performed by the Department in the event of dispute.

(c) Certification of Aggregates
When fine aggregate and open-graded coarse aggregate are shipped to the job site and have been tested and approved at the source, each load of aggregate shall be accompanied by a materials certification statement signed (either handwritten signature, handwritten initials, or computer printout of name or initials) by a responsible company official. This applies to such aggregates as fine aggregate, coarse aggregate for use in hydraulic cement concrete, aggregate for use in surface treatment work, rip-rap bedding stone, porous backfill stone and crusher run aggregate, although crusher run is not an open-graded aggregate. The certification may be stamped or printed on the delivery ticket, invoice, weight ticket or TL-102A Daily Summary Sheet, or it may be a separate document altogether. This does not apply to aggregate or plant mix materials paid for on a tonnage basis, as outlined in Paragraph (b)(1) above. See Paragraph (d) herein.

(d) Documentation of Weights
A bonded Weighperson employed by the Producer shall be responsible for furnishing a daily summary sheet (Form TL-102A) to each order and/or contract. See Sec. 800 for examples of the bond and daily summary sheet. This sheet shall be delivered by the Producer to the Department representative at the project or work area no later than the end of the next working day. On intermittent shipments, this form may be mailed to the appropriate Residency. Recipient of the summary sheet will then reconcile it
against the delivery tickets. Any differences must be resolved. See Post-Construction Manual for further requirements.

(f) Reports
Laboratory test reports of aggregate materials shall be made on Forms TL-22, TL-22A and TL-22B respectively, as outlined in Sec. 800. Shipments of aggregate materials paid for on a tonnage basis will be recorded on a daily summary sheet. (See Paragraph (d) above.) Physical tests and shipments of central-mixed aggregate materials shall be reported on Forms TL-52B (computer test report output form) and TL-102A respectively, as outlined in Sec. 800.

Sec. 204.03 Aluminum Alloys
(Sec. 229) Aluminum alloys (sheet, plate, etc.) are approved for use by the Materials Division from Manufacturer's certified physical and chemical analyses. Inspection, other than visual, is not required by the field, and sampling will not be necessary. See Sec. 207 for modified inspection procedure.

Aluminum which will be in contact with concrete is coated with a bituminous, solvent type, asbestos filled, and aluminum pigmented coating. This coating will be sampled the same as outlined for paint in Sec. 204.24.

Aluminum sign blanks are accepted on visual inspection, with an occasional sample to be checked for dimensional requirements of the specifications (thickness, etc.) For other specific aluminum items, see Fencing, Pipe, and Poles and Posts herein.

Sec. 204.04 Bearing Pads and Bedding Materials
(Sec. 237) See Sec. 207 for materials that may be approved by modified acceptance procedures.

(a) Elastomeric Bearing Pads
A sample shall consist of 1 full size pad sections of each thickness to be selected at random. A sample of 1 pad shall be submitted to the Central Office Laboratory for tests from each shipment of 300 pads or less, with one additional pad being submitted for each additional increment of 300 pads, or fraction thereof.

Each sample shall be marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(b) Sheet Lead and Common Desilverized Lead Bedding Material
This will not require sampling. The material may be approved for use by visual inspection, as outlined in Sec. 207.

(c) Preformed Fabric Bedding Material
(237.02) Samples shall consist of 1 piece 6” by 6”
(150 by 150 mm) by full thickness per lot or batch. The samples are to be submitted to the Central Office Laboratory for testing.

Each sample shall be marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(d) Reports
Laboratory tests and inspections of bearing pads and bedding materials will be reported on Forms TL-23, TL-47, or TL-109 respectively, as outlined in Sec. 800.

Sec. 204.05 Asphalt Material, Liquid
(Specification reference - Sec. 210)
(a) General

Asphaltic materials will be accepted under the VDOT Asphalt Acceptance Program (VAAP). This involves the sampling, testing, documentation and certification of the product by the manufacturer in combination with a Department monitoring effort. VDOT reserves the right to discontinue acceptance of asphaltic material in the event that verification test results indicate that non-specification material is being provided or test procedures are not being followed.

The manufacturer must perform the following responsibilities himself or with the assistance of a VDOT approved commercial testing agency. Asphaltic materials must be sampled at appropriate frequencies and tested in accordance with the specified methods. A file of certified test reports representing the asphaltic material must be maintained. A copy of the certified test report must be provided to the VDOT Materials Division at Elko. Cooperation with VDOT and/or its representatives during periodic inspections of manufacturer's testing facilities, during collection independent assurance (I.A.) (monitor) samples, and during verification of certified test reports is required.

Each manufacturer will detail what steps it will take, from a Quality Control standpoint, to make sure that the material has not been contaminated or experienced changes in tested properties during shipment or in storage. It is the intention of this program that all tanks of material will be tested unless another program is worked out with VDOT.

Asphaltic material manufacturing facilities will be inspected by VDOT personnel or its representatives on an intermittent basis.

(b) Sampling at the point of manufacture, terminal, or other designated site

Samples are to be taken in accordance with AASHTO T40, as modified herein.

Samples taken for testing of asphaltic materials are to be not less than one quart (one liter) of material (0.5 gallon (2 liters) for asphalt emulsions). Care is to be taken to ensure that the samples are not contaminated and that the sample containers are perfectly clean and dry before filling. Immediately after filling, the sample containers are to be tightly closed, and properly marked for identification on the container itself.

Containers for liquid asphalt materials (asphalt cements and cut backs) are to be double friction top cans, oblong cans with screw tops, or small mouth cans with screw caps. Containers for emulsified asphalt are to be wide mouth jars or bottles made of glass or plastic - never metal containers.

Manufacturer's control sampling is to be conducted at the point of manufacture unless otherwise arranged with VDOT. Each company is to submit a proposal of sampling procedures to VDOT, detailing sampling frequency, location and quantity represented by each sample. Upon acceptance of this proposal by the Department, the manufacturer must abide by the procedures accepted, unless other arrangements are made with VDOT.

Verification of manufacturer's testing procedures will be accomplished by independent assurance (monitor) sampling and testing of the material at periodic intervals. Monitor samples will be taken at the terminal under the supervision of VDOT personnel or its representative. The sample taken for monitor acceptance will be a "split" sample, with the manufacturer testing a portion of the sample and VDOT's Central Materials Laboratory at Elko testing the other portion. The planned testing frequency will be at a minimum of 1 test per month per type/grade of asphaltic material that has been supplied to VDOT projects during the previous month. This sampling frequency will be maintained during the construction season, with a lesser frequency during the remainder of the year. After collection, containers of monitor samples, for testing by VDOT, are to be cleaned on the outside and marked according to Section 203, using form TL-10, as outlined in Section 800, and submitted to VDOT's Central Office Materials Laboratory at Elko for testing. Packaging is to be such that breakage and leakage of asphaltic material is
prevented. Due to the time delay in shipping samples to the VDOT facility at Elko, the portion of the monitor acceptance sample to be tested by the manufacturer should be allowed to cool overnight before testing. The sample will be labeled with the terminal code number/tank number/sample number/A or B. The A portion will be sent to Elko for testing while the B portion is sent to the asphalt supplier's testing facility. Both samples will be labeled the same except for the A or B designation. VDOT will be responsible for the shipping of its sample; the terminal or asphalt company will be responsible for the shipping of its sample.

A quality assurance (Q.A.) program will be accomplished with independent sampling and testing of the asphaltic material. Q.A. samples will be taken from the plant storage tank at the asphalt plant for asphalt cements, or on the project for cutbacks and emulsions by a VDOT employee. QA samples will be taken at the rate of one sample per district per year per type/grade of asphalt.

(c) Testing of Material

The manufacturer is to conduct the standard control tests on asphaltic materials as detailed in the appropriate section below. Testing for certified test reports is to be performed by the manufacturer's personnel in the manufacturer's VDOT approved laboratory or by a VDOT approved commercial testing facility. The Department will conduct tests on independent assurance (monitor) samples and on the Q.A. samples at the Elko Materials Laboratory.

Laboratories conducting either quality control, independent assurance (monitor), or Q.A. testing must be certified by VDOT as meeting the requirements of one of the three following levels of certification:

Level I AASHTO Accreditation.

Provide VDOT with a copy of accreditation.

Level II AMRL Certification.

Provide VDOT with copies of last AMRL inspection and/or last "Round Robin" results, with ratings, for each type of asphaltic material tested and copies of the lab's response for each sample.

Development of a calibration program and personnel record keeping procedure, with results to be kept on file at site.

Level III Meets neither I or II.

Development of a calibration program and personnel record keeping procedure, with results to be kept on file at site.

VDOT will certify lab by actual observation of testing.

All Level III testing facilities performing quality control, independent assurance (monitor), or Quality Assurance testing will be evaluated periodically. VDOT Materials personnel will visit the testing laboratories and inspect/approve testing equipment and procedures for conformance to appropriate AASHTO Standards. VDOT will perform the inspection using a checklist to systematically evaluate the equipment and procedures of each method.

All laboratories conducting quality control, independent assurance (monitor), or Quality Assurance sampling, regardless of level of certification, will designate a single person to act as liaison with VDOT. This person will perform and/or oversee the performance of certification testing.

Certified Test Reports for ASPHALT CEMENTS are to be based upon the results of tests performed in accordance with AASHTO M226, table 2. However, the manufacturer will not be required to perform the Cleveland Open Cup, Ductility and Solubility tests unless otherwise directed by the Engineer. VDOT will perform Ductility and Solubility tests on all independent assurance (monitor) and Q.A. samples.
Cleveland Open Cup tests will be performed by VDOT periodically. When performed by VDOT, failure of either sample on Cleveland Open Cup, Ductility or Solubility will be considered sufficient reason to require the manufacturer to perform this testing. If the manufacturer elects to conduct these tests to help better control production, the results are to be included on the certified test report.

Certified Test Reports for CUTBACK ASPHALTS are to be based upon the results of tests performed in accordance with AASHTO M81 and M82 as applicable. However, the manufacturer will not be required to perform the Flash Point, Ductility and Solubility tests unless otherwise directed by the Engineer. VDOT will perform Ductility and Solubility tests on all independent assurance (monitor) and Q.A. samples. Flash Point tests will be performed by VDOT periodically. When performed by VDOT, failure of either sample on Flash Point, Ductility or Solubility will be considered sufficient reason to require the manufacturer to perform this testing. If the manufacturer elects to conduct these tests to help better control production, the results are to be included on the certified test report.

When CUTBACK ASPHALTS are used in surface treatments, the Coating Ability test will be conducted subject to the specifications listed in Section 210.02 of The Road and Bridge Specifications.

Certified test results for EMULSIFIED ASPHALTS are to be based upon the results of tests performed in accordance with AASHTO M208, as specified below.

Ring & Ball Softening Point
Elastic Recovery

The manufacturer will not be required to perform the Ductility and Solubility tests unless otherwise directed by Engineer. VDOT will perform Ductility and Solubility tests on all latex modified cationic emulsions, independent assurance (monitor) and Q.A. samples. When performed by VDOT, failure of either sample on Ductility or Solubility will be considered sufficient reason to require the manufacturer to perform this testing. If the manufacturer elects to conduct these tests to help better control production, the results are to be included on the certified test report.

Certified test results for SUPERPAVE BINDERS are to be based upon the results of tests performed in accordance with AASHTO PP 26, as specified below.
Original Material:
- Flash Point \(^{0}\)C
- Viscosity @ 135\(^{0}\)C/100\(^{0}\)C
- Dynamic Shear, 10 Rad/sec.

RTFO (AASHTO T 240):
- Mass Loss %
- Dynamic Shear, 10 Rad/sec.
- Pressure Aging Vessel, Residue @ 100\(^{0}\)C (AASHTO PP 1)
  - Dynamic Shear, 10 Rad/sec.
  - Creep Stiffness, 60 sec.
  - Physical Hardening
  - Direct Tension, 1.0 mm/min

(d) Test Reports

The manufacturer is to maintain a file of certified test reports for all asphaltic materials ultimately shipped to Contractors that perform work for VDOT. These certified test reports will indicate that the material shipped meets the requirements of that type/grade of asphaltic material and will show the test results that were obtained on that material to determine compliance with the applicable specifications. These records are to be kept by the manufacturer for at least 12 months and are to be available for verification by VDOT personnel. A copy of the certified test report is also to be sent to the VDOT Materials Division at Elko.

The certified test report must be a company's standard form containing the following information:

1) Manufacturer's name and address
2) Type and grade of asphaltic material
3) Testing performed (AASHTO or Virginia Test Method designation)
4) Test results and date obtained
5) Quantity represented
6) Tank number
7) Unique Report Identifier
8) A statement indicating that the manufacturer "certifies that these are the test results obtained on the material tested under the VAAP Program.

(e) Manufacturer's Tracking System

The manufacturer is to submit to the Department a detailed plan of action describing the procedures to be taken to ensure tracking of sample test results and the material represented by these results.

(f) Shipping Documents

All shipping documents will contain sufficient information such that at any point, the material may be "back tracked" to the original test results. If material is mixed with other approved material for storage, the record system will be such as to assure the traceability of all the material which is being mixed. All shipping documents will be accompanied by a statement similar to "We certify that all material being shipped on this invoice/bill of lading has been tested and approved under the Virginia Asphalt Acceptance Program and that the material has been loaded under the supervision of our representative into carriers that are suitable for shipment of this material.

All shipping documents are to be kept by the recipient of the material for at least 12 months and are to be available for verification by VDOT personnel.
Only material tested and certified in accordance with the VAAP may be mixed and shipped to VDOT projects.

**End-Use Certifications**

Each producer of asphalt cement concrete plant mix or slurry seal mix for use on VDOT projects must state on all mix designs submitted for VDOT approval that "only asphaltic materials tested and certified according to the VDOT Asphalt Acceptance Program will be used to produce this mix". The mix producer will maintain a file of VAAP Certifications of Testing to support this statement.

Asphaltic material for use on VDOT projects, which will be used in the same form as received, e.g., prime, tack, surface treatments, etc., will be shipped to the project accompanied by a Certification of VAAP Testing. This certification will be submitted to the project inspector for inclusion in project records. These certifications may be stamped or printed on the delivery ticket, invoice, or weigh ticket, or it may be a separate document altogether.

**Asphalt Usage**

In addition to the required certification, manufacturers, or other suppliers as designated by the Engineer, will submit, to the Materials Division at Elko, on a quarterly basis, a summary sheet of quantities shipped for state work. This summary sheet will show the number of gallons (liters) of each type/grade of asphaltic material shipped to Virginia addresses and accumulated by the Districts to which it is shipped.

**Sec. 204.06 Asphalt Mixtures**

(Sec. 211) Asphalt mixtures (asphalt concrete) shall be sampled, as outlined in Sec. 500.

**Sec. 204.07 Brick**

(Sec. 222) See Sec. 207 for acceptance of brick on modified inspection procedures. Brick in orders of 1000 or less may be accepted in this manner. Otherwise brick shall be sampled in accordance with AASHTO T32. At least 10 bricks shall be sampled from each lot of 50,000 brick, or fraction thereof.

For lots of more than 500,000, 5 shall be sampled for each 100,000 or fraction thereof, but not less than 10.

Samples shall be submitted to the District or Central Office Laboratory, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

**Sec. 204.08 Bronze and Copper Alloy**

(Sec. 230) Cast bronze and copper alloy may be accepted on modified inspection procedures, as outlined in Sec. 207, provided the Materials Division has received a Manufacturer's certified physical and chemical analysis representing the material.

**Sec. 204.09 Cement, Hydraulic**

(32R SB Sec. 214) Hydraulic cement will be accepted by the following; a letter with a notarized signature documenting that each cement type, used on VDOT projects meets the requirements in Section 214 of the VDOT Road and Bridge Specifications. The letter shall include the maximum alkali content that the cement will not exceed for the calendar year. If submitting a letter for blended cement (Type IP or IS), the percent mineral admixture for the types of blended cement with mineral admixture added shall be
listed in parentheses, e.g. Type IP(20). A one gallon sample of cement with the corresponding mill certification shall also be submitted for each type of cement. Once approved, the cement source will be added to Approved List No. 85 for “Cement Manufacturers”.

The Mill’s control laboratory will be inspected regularly by the Cement and Concrete Reference Laboratory of the National Bureau of Standards. A minimum time between inspections is not established; however, it is expected that the Mill will request an inspection for each tour made by the CCRL team. The Mill will retain a copy of these reports together with any correspondence regarding deficiencies to be reviewed by a State Materials Engineer’s representative if requested.

In addition, the Cement Company will furnish the State Materials Engineer a certification letter annually. This letter will contain wording similar to the following:

"Company Letterhead"

Date

Dear Sir:

The cement to be furnished during 20__ will be produced at _________(mill) __________. We certify it will be manufactured under our normal quality controlled processes and will, based on our test results, meet the requirements of Type _____, for Virginia Department of Transportation’s Specifications.” and the alkali content will not exceed _____ for the year.

This letter is to be signed by a responsible company official, notarized and should be mailed by December each year.

Where cement is paid for by the ton (metric ton) as a bid item in the contract (soil-cement stabilization), weights will be determined by a digital printer scale.

The truck will be weighed before loading and after loading to determine the net amount delivered to the project. Scales will be sealed and approved. Copy of this ticket will be delivered to the Inspector with the shipment of cement. The Inspector will visually inspect each truck after discharge and prior to its leaving the job site. Should the truck not be completely emptied, a corrected weigh ticket must be prepared and supplied to the Inspector.

Sec. 204.10 Snow and Ice Control Materials

(a) Solids

(Sec.239) Solid – snow and ice control materials shall be sampled and approved in the manner outlined herein. This control system is designed to improve the flow into the State of approved snow and ice control materials, so that the delivery and emergency use of nonconforming material will be reduced to a minimum.

1. Sodium Chloride

(a) Sampling

Whenever it is economically feasible and inspection service is available, sampling will be done at the manufacturers’ stockpiles, from containers or indoor storage. Sampling will be at the approximate rate of one sample per 10,000 tons (10,000 metric tons) at stockpile locations or one sample per 5,000 tons (5,000 metric tons) if sampled at final destinations. No samples shall be taken from uncovered stockpiles while it is raining. Sampling shall be performed in accordance with ASTM D 632. A minimum of three (3) sample increments shall be selected at random from the lot (10,000 or 5,000 tons) (10,000 or 5,000 metric tons). Each increment shall be obtained by scraping aside the top layer of material to a depth of at least one inch (25 mm) and taking a one-pound (2 kg) quantity of sodium chloride to a depth of at least
six inches (150 mm). The sample increments shall be thoroughly mixed and quartered (in accordance with ASTM C702) to constitute a composite sample. The minimum required composite sample size is one quart (one liter).

All samples shall be submitted to the Central Office Laboratory in either a metal paint can with an air-tight cover or a plastic cylindrical concrete mold container with the cover firmly attached and marked, in accordance with Sec. 203 and Sec. 800.

All shipments shall be subject to visual inspection at destination before unloading. Any shipments deemed to be unusable because of excessive water, oversized material or extraneous material maybe rejected at the option of the Engineer. In the case of storm events, the Engineer reserves the right to accept and use any product delivered and to apply price adjustments as defined in the purchase contract. A sample may be taken for analysis to determine the price adjustment.

(b) Shipment
When shipments are made from out of state stockpiles, an inspection service will be provided when the frequency of shipments makes it economically justified. The Supplier shall certify that the material came from an approved stockpile and the stockpile’s location shall be on the shipping ticket.

(c) Rejection
Delivered material not conforming to the specification may be subject to a price adjustment or rejected and returned at the Producer’s option. Material not conforming and not returned will be subject to the price adjustment schedule in the purchase contract. In no case will the price adjustment of any retained material be over 50%. Inspection Reports (Form TL 109) shall be provided to the residencies.

2. Calcium Chloride and Magnesium Chloride
Calcium chloride and magnesium chloride will be sampled at the rate of one sample per manufacturer per District. Sampling shall be conducted in accordance with ASTM D 345. For bag shipments, select not less than three containers at random. Take 1 lb (0.5 kg) samples by means of a sampling tube penetrating at least 1 ft. (300 mm) into the bag. For small containers with capacity of less than 10 lbs. (5 kg), use the entire contents of the container. For bulk shipments, select increment samples from at least three locations in the shipment. Scrape aside the top layer to a depth of one foot (300 mm). Using a sampling tube, obtain a sample extending from the cleared surface to at least 50% of the depth of the material in the container, or a depth of approximately three feet (one meter), whichever is less. Mix the increment samples together and fill the one-quart (one liter) container. Use caution during the sampling operation to avoid exposing the sample unduly to atmospheric moisture. If more than one sample is taken, immediately and thoroughly mix the individual samples to form a representative composite sample of material and store in a sealed plastic container. Sample shall be submitted to the Central Office Materials Laboratory in a plastic airtight container (plastic cylindrical concrete mold containers are acceptable) in accordance with Sec. 203 and Sec. 800.

3. Calcium Magnesium Acetate
Calcium Magnesium Acetate (CMA) will be sampled at the rate of one sample per manufacturer per District. Three (3) sample increments shall be selected at random from the lot. Each increment shall be obtained by scraping aside the top layer of material to a depth of six inches (150 mm) and taking a half-pound (0.25 kg) quantity to a depth of six inches (150 mm). The sample increments shall be mixed to constitute a composite sample. The sample size shall be one quart (one liter) and shall be submitted to the Central Office Materials Laboratory in a metal paint can with an airtight cover in accordance with Sec. 203 and Sec. 800.
4. Solids with Agricultural Processing Residue

These snow and ice control materials shall be stored undercover and protected from cross contamination from other snow and ice control materials. They will be sampled at the minimum rate of one sample per manufacturer per District. The sample size shall be one quart (one liter) and shall be submitted to the Central Office Materials Laboratory in an airtight metal paint can or air-tight plastic container in accordance with Sec. 203 and Sec. 800.

(b) Liquids

Liquid snow and ice control materials shall be sampled and approved in the manner outlined herein. This control system is designed to improve the flow into the State of approved liquid snow and ice control materials, so that the delivery and emergency use of nonconforming material will be reduced to a minimum.

Samples taken for testing of liquid snow and ice control materials shall be not less than one quart (one liter) of material. Sample container shall be plastic Nalgene Wide Mouth plastic container with an airtight seal. Sampling shall be done in accordance with ASTM D345 and shall be taken from the storage container during discharge. Before sampling, the solution shall be recirculated in the tank until it is homogenous. Care shall to be taken to ensure that the samples are not exposed unduly to atmospheric moisture. Samples shall be taken when the temperature is above 40°F (4°C). The temperature of the material at sampling shall be recorded on the TL-10 card. Samples shall be submitted to the Central Office Materials Laboratory in accordance with Sec. 203 and Sec. 800. Samples will be taken each year at the time of the first liquid snow and ice control material delivery. The frequency of sampling shall be a minimum of one sample per manufacturer per District.

Sec. 204.11 Concrete, Hydraulic Cement

(Sec. 217) Hydraulic cement concrete will be sampled, as outlined in Sec. 400.

(a) High Strength Grout and Mortar

(218) High-strength grout and mortar may be accepted on any job by means of a letter of certification from the manufacturer, which shall include independent laboratory results showing the following: the grout/mortar develops a 7-day compressive strength of at least 4000 pounds per square inch (28 MPa) when tested in accordance with ASTM C-109, a 7 day bond strength of at least 1000 pounds per square inch (7 MPa) when tested in accordance with VTM-41 except that epoxy was not used to develop the bond, and compliance with ASTM C-1107.

Sec. 204.12 Copper Sheet and Strip

(Sec. 230) Copper sheet and strip shall be accepted on modified inspection procedures, as outlined in Sec. 207, since no testing or certification is required.

Sec. 204.13 Curing Materials and Protective Coatings for Concrete

(a) Curing Materials

(Sec. 220) Materials used for the curing of hydraulic cement concrete shall be sampled as follows:

(1) Liquid Membrane Seal

Liquid membrane seal shall be shaken or stirred thoroughly in the container, much as described for paint in Sec. 202.24, before the sample is taken. A one quart (one liter) sample shall be taken at random from a single container representing each specific lot, batch, or other unit of production in a shipment, provided that no sample shall represent more than 5000 gals (20,000 liters).
Each sample shall be packed and marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800. A metal container, properly capped, may be used for sample shipment to the Central Office Laboratory.

(2) Burlap
Burlap shall be sampled by obtaining one sheet 4 ft (1 m) by width of roll and submitting this to the Central Office Laboratory for test. One sample shall represent each specific lot, or other unit of production in a shipment.

A packaging envelope may be used for sample shipment. Each sample shall be packed and marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(3) Polyethylene Sheeting
Polyethylene sheeting shall be accepted based upon the Department’s approved List.

(4) Waterproof Paper
Waterproof paper shall be sampled the same as outlined in Paragraph (a)(2) above.

(5) Monomolecular Film
Chemicals, such as monomolecular film, used in the placement of concrete to prevent or reduce evaporation of curing water from the concrete surface, will require no sampling, testing, or certification, and may be accepted on modified inspection, as outlined in Sec. 207. Satisfactory job performance will be considered as proof of acceptance.

(6) Reports
Laboratory tests and inspections of curing materials will be reported on Forms TL-24 and TL-109 respectively, as outlined in Sec. 800.

(b) Protective Coatings
Materials used for the protection of hydraulic cement concrete surfaces shall be accepted as follows:

(1) Silicone Treatment
Silicone spray treatment, applied to hydraulic cement concrete surfaces where unpainted ASTM A588 steel is used, shall be sampled by obtaining a one quart (one liter) sample of the treatment, either at the source or at the job site. The sample shall be submitted to the Central Office Laboratory for test in a clean, airtight, metal or glass container. One sample per job will be sufficient.

The sample shall be packed and marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(2) Spray-On Surface Finish
Materials used as spray-on surface finishes for hydraulic cement concrete surfaces are approved for use by an approved list. Inspection, other than visual, is not required in the field, and sampling will not be necessary. See Sec. 207 for modified inspection procedures.

(3) Reports
Laboratory tests and inspections of silicone treatments will be reported on Forms TL-47 and TL-109 respectively, as outlined in Sec. 800.
Sec. 204.14 Electrical Conduits, Fittings, and Boxes
(Secs. 238, 703, and 705) See Sec. 207 for materials that may be accepted on modified inspection procedures.

(a) Acrylonitrile-Butadiene-Styrene (ABS) Conduit and Fittings
ABS conduit shall be sampled by obtaining one full length of conduit for each size diameter per shipment. Fittings may be accepted on modified inspection, as outlined in Sec. 207, since these do not require testing or certification. However, these shall be made of the same or equivalent material as the conduit.

All samples shall be submitted to the Central Office Laboratory loose, with Form TL-10 attached. The samples shall be marked and shipped, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(b) Metal Conduit and Fittings
Metal conduit shall be accepted from one of the following: Manufacturer’s certification, catalog cut or the Virginia DOT Pre-Approved Traffic Control Device Listing from Mobility Management. At the discretion of the Engineer to determine acceptance, metal conduit shall be sampled by obtaining 2 pieces, one from each end of one length of pipe, for each size diameter per shipment. The lengths of the 2-piece sample shall be a minimum of one 8 in. (200 mm) piece from each end. The samples should be sawed true from the ends of a length picked at random.

Fittings shall be approved by modified inspection, as outlined in Sec. 207, provided that the Materials Division has received a Manufacturer's certified analysis of the test report, which includes the zinc content.

Samples shall be packed, marked, and shipped the same as outlined in Paragraph (a) above.

(c) Plastic and Poly (Vinyl Chloride)(PVC) Conduit and Fittings
Plastic and PVC conduit and fittings may be accepted on a manufacturer or supplier certification stating that only PVC, Schedule 40, UL approved conduit will be used. Verification that Schedule 40 is being used may be made through the District Materials Office. It is not absolutely necessary that the same brand of material be used in the same installation, as long as the parts "mate" and meet the above criteria. Any certification which are incomplete will be denied and sampling will be required. The sample shall be minimum of 2 ft. (0.6 m) in length, and contain the UL label.

(d) Plastic and PVC Telephone Conduit
Telephone conduit may be accepted on Manufacturer or Supplier Certification stating the specifications for and type of conduit.

(e) Boxes
Boxes, except junction boxes, require no sampling, and may be accepted on modified inspection, as outlined in Sec. 207, since these require no testing or certification. For concrete junction boxes, two (2) 6 X 12 in. (150 X 300mm) or three (3) 4 X 8 in. (100 X 200 mm) cylinders will be obtained and tested on a random basis. For metal junction boxes, thickness of coating will be tested on a random basis using a magnetic thickness gauge, in a manner similar to that specified for coated corrugated steel pipe in Sec. 204.26(h).

(f) Other Electrical Components
Electrical materials, supplies, and equipment, other than those noted above, used in traffic signal installations or other types of electrical systems, will usually be accepted on the basis of Manufacturers' certifications, catalog cuts (under certain conditions), and/or, generally in the case of traffic control materials and equipment, accepted on the basis of the Pre-Approved Traffic Control Device Listing
published by the Traffic Engineering Division. This includes such items as, electrical wire and cable (conductors and ground wires conforming to ASTM B3 and B8, or B2 respectively, or other specified and approved types), connectors and terminals, controllers, detectors, insulators, junction, splice, and switch boxes, controller cabinets, lamps, switches, relays, and traffic signal heads, among others. See Sec. 207 for additional details of acceptance of these items by modified inspection and certification/catalog cut/Pre-Approved List.

For acceptance of electrical system structural elements, such as wood poles, steel poles (anchor base, mast arm, luminaire, etc.), steel plates, high strength steel bolts, ground clamps, anchor rods and span and guy wire, see Secs. 204.28, 204.33, 204.32, 204.36, and 207 respectively.

(g) Reports
Laboratory tests of acrylonitrile-butadiene-styrene (ABS) and bituminous conduit will be reported on Form TL-29, laboratory tests of cylinders will be reported on Form TL-26,(TL-26 B, if computerized test report output form), laboratory tests of metal conduit will be reported on Form TL-25, and inspection will be reported on Form TL-109, as outlined in Sec. 800.

Sec. 204.15 Epoxy Resins
(Secs. 212, 223, and 243) A sample of epoxy resin shall consist of one qt. (one liter) of the lesser component and enough of the larger component for proper mixing. Epoxy loop sealant, for use in traffic signals and conforming to Sec. 212, Road and Bridge Specifications, shall be tested in the Central Office Laboratory, and shall likewise be sampled as outlined herein. One sample shall be submitted to the Central Office Laboratory representing each lot or shipment. Contents being sampled should be mixed thoroughly before sampling. Samples shall be shipped in clean cans, each component in a separate can and shall contain the following information clearly labeled on the containers: (1) identity of component, (2) type, (3) mixing directions, (4) usable temperature range, (5) name of Manufacturer, (6) lot or batch number, (7) date of packaging, (8) pigmentation if any, and (9) quantity contained therein in lbs. (kg) and/or gals (L). When the quantity is l5 gals. (60 L) or less for any one project, epoxy resins may be accepted on Manufacturer's certification, as outlined in Sec. 207.

Samples shall be marked and shipped, in accordance with Sec. 203, using Form TL-10, as outlined in Sec 800. Laboratory tests and inspections of epoxy resins will be reported on Forms TL-30 and TL-109 respectively, as outlined in Sec 800. Powdered epoxy resins are accepted by an approved list. (See Chapter 7).

Sec. 204.16 Fencing
(Sec 242) Fencing products will be accepted based upon certification from the manufacturers that VDOT fence specifications are being met. Fence will be supplied to the project by approved fence suppliers.

(a) Fence Manufacturer’s Requirements

To qualify for placement on the Fence Manufactures Approved List # 69 the manufacturer must:

1. Certify that their products are Made in the USA and meet the applicable ASTM, AASHTO or other VDOT specifications. Certifications must include the following information on company letterhead: Manufacturer Name, Manufacturing Location, Product Description, and the following statement with signature:

   “We certify that these fence products are Made in America and meet the following VDOT specifications:” (list the applicable specifications)
The manufacturer certifications must be approved by the CO Materials Division Chemistry Lab Program Manager (or designee).

2. Provide approved certifications to VDOT Materials and the fence supplier annually.
3. Provide fence samples to the Chemistry Lab for certification validation, if required.

(b) Fence Supplier’s Requirements

VDOT project level acceptance will be based on the requirements of the VDOT Fence Suppliers Quality Assurance Program as outlined below. This involves the documentation and certification of the product by the Supplier in combination with a Department verification sampling and testing program (VST). VDOT reserves the right to discontinue acceptance of fence in the event that VDOT verification efforts indicate that non-specification material is being provided or quality control plans are not being followed.

The following types of fence may be accepted under this program: (1) Chain Link; (2) Tension Wire; (3) Barbed Wire; (4) Lawn Fence; (5) Woven Wire; (6) Brace Wire; (7) Posts; and (8) Snow Fence.

In order to supply fence products to a VDOT project, the fence supplier shall be on the Materials Division Approved List No. 70 and use products “Made in the USA” from Approved List No. 69 or wood products treated by companies on Approved List No. 45. To qualify for placement on this list, the fence supplier shall submit a Quality Control (QC) Plan defining their routine business quality control practices. The QC plan shall be submitted to the Materials Division Central Office Quality Assurance Section. After review for completeness and conformance of the supplier’s QC plan to the Quality Control Fence Suppliers’ Plan Checklist as found in the Appendix J of this chapter, a facility visit will be made to evaluate the supplier’s conformance to his QC Plan. If during the inspection deficiencies are noted, this will be documented in a report with a follow-up visit scheduled. If no deficiencies are found, the fence supplier is probationally approved until one or more successful projects have been completed demonstrating conformance to the QC plan and that a quality product has been consistently supplied. If problems are encountered during supply within this probationary period, then additional projects may be necessary for the producer to work out QC Plan conformance issues. The fence supplier will be added to the Approved List No. 70 with a “p” to denote that the facility is probationally approved. Once the probationary period has been successfully completed, the “p” will be removed. The Department will continue to monitor the facility to ensure conformance to the QC plan and project specifications. Annually, the Department will review the updated QC plan submitted by the supplier and update the Approved List with the latest review date. The approving/revoking authority is the Quality Assurance Engineer for suppliers and the Chemistry Laboratory Program Manager for Manufacturers. Appeals may be submitted to the State Materials Engineer for final disposition.

Shipping tickets for material sent to VDOT Projects shall include the following information: Contractor information, VDOT Project Number, Material Identification, Material Quantities shipped and the following QC statement along with signature:

“We certify that these fencing items meet VDOT specifications and conform to the VDOT Fence Suppliers Quality Assurance Program”

For fencing that may be approved on modified inspection, see Sec. 207.

Sec. 204.17 Fly Ash

(Sec 241) Fly Ash may be accepted in any job by means of a letter from the Fly Ash Marketing Company certifying it meets specification requirements, as outlined herein, and in the Road and Bridge Specifications.
Class “F” Fly Ash will be approved based on its conformance to the requirements of ASTM C618.

Class “C” Fly Ash will be considered for approval only when the producer submits independent ASTM C441 test data to support the replacement level of fly ash needed to remediate Alkali Silica Reactivity (ASR). The replacement amount must be sufficient as to limit expansion to less than 0.1% (when normalized) with an alkali content of the cement at least equal to the maximum alkali expected to be encountered. This data will be reviewed by the State Materials Engineer and verified by testing before final approval is granted.

The Fly Ash Company will assure the Department of its quality control program by stating in detail its frequency of sampling and testing and other production control. Any changes shall be reported immediately to the State Materials Engineer.

In addition, the Fly Ash Company will furnish the State Materials Engineer a certification letter annually. This letter will contain wording similar to the following:

"Company Letterhead
__________________ Project Number _______________
__________________ Date

Dear Sir:

The fly ash to be furnished during 19__ will be produced at _________(power plant). We certify it will be monitored under our normal quality controlled processes and will, based on our test results, meet the requirements of Type _______ Fly Ash according to Virginia Department of Transportation's Specifications."

This letter is to be signed by a responsible company official and should be mailed about mid-December each year. Distribution of this certification letter will be made immediately by the State Materials Engineer to the District Materials Engineer.

The Fly Ash Plant will maintain a file of the test results for Fineness, Loss on Ignition, Moisture Content and Specific Gravity on each 400 ton (400 metric ton) lot from which shipments will be made. The Plant will furnish a complete chemical and physical test report on a composite sample representing each 2000 tons (2000 metric ton). This composite sample will be prepared by combining equal parts of five consecutive samples representing the 400 ton (400 metric ton) lots. Lot numbers should be designated in such a manner that the lot can be identified with the date shipped. It will be satisfactory to submit the lab report after the 28 day test results are complete. IT IS NOT DESIRED TO RELATE THIS REPORT WITH A PARTICULAR PROJECT.

Upon shipment of fly ash to a project, the Plant will enter on the delivery tickets the date, lot number, and truck or rail car number. The lot number used will be that of the Plant and not one of an intermediate terminal.

**Sec. 204.18 Guardrail, Steel Beam**

(Sec. 221) See Sec. 207 for additional details of modified acceptance. Steel beam guardrail will be accepted on the basis of modified inspection. This also includes associated hardware; such as, offset blocks, terminal sections, and fixed object attachments, among others. (For requirements for accepting guardrail posts, see Sec. 204.28).

The guardrail Supplier or Erector shall file with the State Materials Engineer an annual certificate of compliance and guarantee on July 1, of each year, similar to the one below. Any additions to the list will
require submittal of an updated certificate. Certificates will be kept on file in the Central Office Laboratory Structures Section. The suggested certificate is as follows:

SUPPLIER’S OR ERECTOR’S LETTERHEAD

CERTIFICATE OF COMPLIANCE AND GUARANTEE

We, ____(Name of Erector)______, State of ____________, certify that guardrail material to be erected on Virginia's highway construction projects and guardrail material to be supplied for Virginia's maintenance orders will conform to the requirements of the specifications as noted in the Road and Bridge Specifications. It is further certified that all of our material Suppliers will be required to furnish us mill analyses and/or certifications for each shipment of material ordered. These documents will be on file and will be available to the Virginia Department of Transportation upon request.

The following is a list of Manufacturers and Suppliers which will be furnishing to our organization guardrail material and associated hardware:

1. (Name of supplier and address)
2. 
3. 
4. 
5. 
6. 

Any additions to the above will require submittal of an updated certificate of compliance and guarantee. A new certificate of compliance and guarantee will be submitted to the State Materials Engineer on an annual basis on July 1, of each year.

We will replace, without cost to the Department, any guardrail material that is not in conformity with the specifications.

State of __________________   ________________________Erector's Name
County of _________________   _______________________

It will be necessary that District personnel obtain check samples consisting of a minimum of 2 linear ft. (0.6 m) of beam (no bolts, nuts, nor washers), selected once each 6 months per construction District, and submit to the Central Office Laboratory for testing. This sample normally is taken at the project.

All samples of guardrail shall be marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800. Laboratory tests and inspections of guardrail beam will be reported on Forms TL-25 and TL-109 respectively, as outlined in Sec. 800.

Sec. 204.19 Joint Materials

(Sec. 212) See Sec. 207 for joint materials that may be accepted on modified inspection. Joint fillers, joint sealers, and pipe gaskets shall be sampled as follows:

(a) Elastomeric Expansion Dam

Elastomeric expansion dam shall be accepted by the submission of certified materials test results from a qualified independent testing laboratory and a certification from the Manufacturer that the material meets or exceeds the applicable specification.
Structural steel, aluminum, and anchor bolts used in expansion dams will be accepted on mill analyses, as outlined elsewhere herein.

(b) Expanded Rubber Joint Filler
Expanded rubber joint filler shall be sampled by obtaining one sq.ft. (0.09 m²) of each thickness and for each lot or shipment received. Samples shall be submitted to the Central Office Laboratory either loose or in a packaging envelope.

Samples shall be marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(c) Hot-Poured Joint Sealer
This shall be sampled by cutting one piece, of about 10 lbs. (5 kg), from the original container. One sample shall be taken from each shipment or lot. In no case shall a sample be taken from the heating kettle. The sample may be wrapped in paper and shipped, without boxing, to the Central Office Laboratory for tests. In the Laboratory, test specimens are cut from the inner portion, whether surface contamination is apparent or not. Wrapping paper adhering to the sample is, therefore, not objectionable.

Each sample shall be marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(d) Poly(Vinyl Chloride) (PVC) and Polyethylene Joint Fillers
These shall be sampled by obtaining one section of full thickness not less than 2 ft. (0.6 m) long and the full depth of the joint from each consignment of 1000 sq.ft. (100 m²) or less. At least one sample shall be taken for each thickness of joint and one for each type or brand. These samples shall be enclosed in a box or securely tied to a piece of board, so that they may be transported without damage. Nails must not be used to fasten the sample to the board. Samples shall be submitted to the Central Office Laboratory for tests.

All samples shall be marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(e) Preformed Chloroprene Seal
This shall be sampled, packed, marked, and shipped, in accordance with Paragraph (b) above.

(f) Preformed Elastomeric Joint Sealer
One sample of preformed elastomeric joint sealer shall be obtained for each thickness or size and for each lot or shipment received, and submitted to the Central Office Laboratory for tests. The size of sample should be 2 lin. ft. (0.6 m) of each thickness or size. No shipping container is necessary.

The lubricant adhesive to be used with the seal shall be accepted on certification from the manufacturer that it conforms to the requirements of ASTM D4070.

All samples shall be marked, in accordance with Section 203, using Form TL-10, as outlined in Sec. 800.

(g) Preformed Joint Filler (Bituminous Types)
Visual Inspection.

(h) Pressure Joint Relief Material
This shall be sampled by obtaining one piece one ft. (300 mm) in length for each size per lot. The sample shall be submitted to the Central Office Laboratory for tests. No special packaging is required.

Samples shall be marked, in accordance with Section 203, using Form TL-10, as outlined in Sec. 800.
(i) **Pipe Joints and Connections and Pipe Coatings**

Gaskets, bands, and other joint materials, and joint configurations where they are used, shall be submitted to the Materials Division for review and listing on Approved List No. 14. Joint test certifications shall also be submitted to qualify joints as silt-tight or leak-resistant. Any change in joint configuration or material shall require a resubmission of material and joint certifications. Pipe coating materials shall also be submitted for listing on Approved List no. 14.

(j) **Sponge Rubber Joint Filler**

This shall be sampled, packed, marked, and shipped, in accordance with Paragraph (d) above. When used in conjunction with bridge bearings, samples shall also be obtained and tested in the same manner as outlined above.

(k) **Waterstops**

Elastomeric waterstops of chloroprene or poly(vinyl chloride) shall be sampled by obtaining one piece one ft. (300 mm) in length for each size per lot. Samples shall be submitted to the Central Office Laboratory for tests. No special packaging is required.

Samples shall be marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

Metal waterstops consisting of sheet copper will be accepted on modified inspection, with no testing or certification required, as outlined in Sec. 204.12.

(l) **Silicone**

Silicone joint material will be accepted on the basis of a list distributed by the Materials Division, and only visual inspection is required at the job site.

(m) **Reports**

Laboratory tests and inspections of joint materials will be reported on Forms TL-23 (expanded rubber, poly(vinyl chloride) and polyethylene, preformed chloroprene, preformed elastomeric, pressure joint relief material, pipe gaskets, and waterstops), TL-47 (hot-poured, preformed (bituminous), sponge rubber, and preformed elastomeric lubricant-adhesive), and TL-109 respectively, as outlined in Sec. 800.

**Sec. 204.20 Landscape Materials (Roadside Development)**

(Sec. 244) See Sec. 207 for additional details of acceptance of landscape materials by modified inspection.

(a) **Fertilizer**

Fertilizer will be accepted on visual inspection, in accordance with Sec. 244.02 of the Road and Bridge Specifications with approval of the Environmental Quality Division.

(b) **Herbicides**

Herbicides are to be visually inspected to determine that the Manufacturer's container is labeled as required. The label should include the herbicide composition, brand, and name and address of the Manufacturer. Questionable sources will be checked to determine that the material is registered with the Department of Agriculture and Consumer Services.

(c) **Lime**

Acceptance of lime will be handled, as outlined in Sec. 204.21 (a).

(d) **Mulch, Wood Cellulose Fiber, for Hydraulic Seeding**

Fiber mulch approval is based upon an annual source/inventory sampling program conducted prior to shipment. Material (sources) meeting specification requirements will be listed on approved lists.
published periodically. (See Chapter 7 for current approved list.) Visual inspection is all that is required at the point of delivery.

For approval purposes, 3 samples selected randomly will be taken from each source by a designated representative of the Department and submitted to the Central Soils Laboratory. The average results of these test samples will be the basis for determining compliance with VDOT specifications. If in compliance, the source will be placed on the approved list. If the material is found to be unacceptable, the source will be notified by letter that their product is being removed from the approved list. To be reinstated, the Producer either must furnish a product conforming to his/her stated guarantee or adjust the stated guarantee of the dry weight per bag, if this is the deficiency. If the deficiency is in the physical properties of the mulch, conformance and approval shall be determined by additional random samples obtained by a Department representative. Of course, the Producer has the option to remain off the list and request to be included in the next annual check.

Any additional testing of approved, but questionable, mulch from shipments received at the point of delivery is at the option of the Engineer; however, when tests are run, the moisture/dry weight of the shipment used for price or application adjustments shall be based on a sufficient number of random samples (average of at least 3). If the District Materials Engineer does perform this additional testing, the test results shall be reported to the District Environmental Coordinator or Specialist.

(e) Seed and Sod

Seed and Sod will be accepted on visual inspection, in accordance with Sec. 244.02 of the Road and Bridge Specifications with approval of the Environmental Quality Division.

(f) Geosynthetics

This section covers geosynthetics used in: silt fence, riprap bedding, drainage fabric, subgrade and embankment stabilization, geocomposite pavement underdrains and wall drains, dewatering bags, pavement interlayer reinforcement, prefabricated vertical drains; and high strength geotextiles and geogrids that require project-specific design and are used in reinforced slopes, base reinforcement, and MSE wall applications.

Geosynthetics approved for use on VDOT projects can be found on the following approved lists:

- Approved List #37 Wall Drains
- Approved List #39 Prefabricated Vertical Drains
- Approved List #60 Dewatering Bags
- Approved List #63 Geosynthetics
- Approved List #64 Geomembrane Moisture Barriers, and Low Permeability Liners (Hydraulic Barriers) for use in Stormwater Retention

- Approved List #37 – Suppliers submit their products, which must meet the VDOT Road and Bridge Specification 245, and the fabric must be current in the NTPEP 3-year product evaluation testing.
- Approved List #39 – Suppliers submit their products, which must meet the material requirements of the VDOT Standard Special Provision for Prefabricated Vertical Drains, and the fabric must be current in the NTPEP 3-year product evaluation testing.
• Approved List #60 – Suppliers submit their products, which must meet the VDOT Road and Bridge Specification 245, and the fabric must be current in the NTPEP 3-year product evaluation testing.

• Approved List #63 - A product and its manufacturer and supplier are placed on the approved list upon request of the manufacturer or supplier. The geosynthetic must meet VDOT’s specification or standard special provision requirements and be current in the NTPEP 3-year product evaluation testing. The manufacturer must be compliant in the NTPEP audit program, and the local supplier must be annually reviewed by VDOT and thereby listed on VDOT Approved List 44 or be audited by NTPEP.

• Approved List #64 - Suppliers submit their products, which must meet the VDOT Road and Bridge Specification 245, and the fabric must be current in the NTPEP 3-year product evaluation testing.

The AASHTO M288 fabrics on Approved List #63 and manufacturers fall under the GTX Work Plan of the Geosynthetics Committee of NTPEP, the high strength geosynthetics and geogrids fall under the Reinforcing Geosynthetics (REGEO) work plan of the Geosynthetic Committee. Additionally silt fence must meet the slurry test requirements of the work plan of the Erosion Control Products Committee of NTPEP, pavement interlayer reinforcement must have independent melting point testing done, and these results provided to VDOT.

**Sec. 204.21 Lime**

(Sec. 240) See Sec. 207 for acceptance of lime on modified inspection.

**(a) Agricultural**

(Sec. 244.02) Agricultural grade ground limestone shall be approved for use as follows. The Environmental Quality Division will periodically provide a list that will be forwarded to the District Materials Engineer, showing the results of laboratory tests of agricultural lime from sources supplying Virginia. (See Chapter 7) The District Materials Engineer should compare the source of materials list for each applicable project with the Department of Agriculture list, to see that lime from the proposed project source meets the requirement for calcium carbonate equivalent (not less than 85 percent).

Where doubt exists about the carbonate content or in cases of lime received from sources not on the Agriculture Department list, a sample should be obtained and submitted to the Central Office Chemistry Laboratory.

It should be noted on the Department of Agriculture lists that there may be lime sources listed that do not meet specification requirements, with regard to calcium carbonate equivalent.

**(b) Hydrated**

Hydrated lime may be accepted on visual inspection, based on receipt of Manufacturer's certification by the Materials Division, as outlined in Sec. 207.

However, if the lime is from a new source, it will be necessary to secure a sample of approximately one qt. (one L) in size for testing. This sample will normally be taken at the point of delivery. Care must be exercised to see that a representative sample is obtained completely free from any contamination. The sample shall be submitted to the Central Office Laboratory in a closed, airtight container, usually a metal container or mason jar, and shall be marked in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.
(c) **Hydraulic**

This shall be approved for use, as outlined in Paragraph (b) above.

(d) **Reports**

Laboratory tests and inspections of lime, when conducted, will be reported on Forms TL-47 and TL-109 respectively, as outlined in Sec. 800.

**Sec. 204.22 Masonry Units, Concrete**

(Secs. 222 (a)(1), (a)(2), (a)(3), and (b)) Concrete masonry units normally shall be sampled by the Department's representative assigned to the particular plant making shipment. These samples are to be taken at the source of manufacture, if possible, prior to shipment to a project in order that the Materials Division can issue a test report prior to the use of the masonry units in the construction.

(a) **Wall Units**

Masonry wall units, consisting of hollow load bearing units, hollow non-load bearing units, or solid load bearing units shall be sampled, as outlined herein. A sample shall consist of 10 whole units for lots of 10,000 units, or fraction thereof. For lots of 10,000 to 100,000 units, a sample shall consist of 20 whole units. For lots of more than 100,000 units, 10 whole units shall be sampled from each 50,000 units, or fraction thereof. When the shipment consists of block of various different sizes, only the one minimum rate of sampling specified above will apply, and it will not be necessary to duplicate the size of sample for each size of block in the shipment. The samples shall be shipped to the District or Central Office Laboratory for testing. No container is necessary for shipment of the sample.

The samples shall be marked and shipped, in accordance with Sec. 203, using Form TL-10, as outlined in Sec 800.

(b) **Catch Basins and Manholes**

(For sampling of brick used in catch basins and manholes conforming to AASHTO M91, Grade MS or ASTM C55, Grade N-I, see Sec. 204.07.) Masonry units used in catch basins and manholes shall be sampled, marked, and shipped to the Laboratory for tests, as outlined in Paragraph (a) above.

However, care must be exercised in selecting units submitted for tests. At least 1/2 of the number of units submitted in a sample MUST BE BARREL BLOCKS. The shape of batter blocks prevents conducting a proper compression test on these particular units. However, batter blocks can be used for absorption tests.

(c) **Miscellaneous Precast Units**

Precast concrete manholes, box culverts, and other precast concrete products (excluding concrete pipe, and prestressed concrete), conforming to the applicable VDOT specifications or special designs approved by VDOT will be accepted on the manufacturer’s certification based on the requirements of the VDOT Precast Concrete Products Quality Assurance Program as outlined below.

When approving hydraulic cement concrete mix designs, the following items are not required to meet the minimum pozzolan additions as outlined in the Virginia Department of Transportation Road and Bridge Specifications, Section 217.02a: oil grit separators; T-MH-2, cones, grade rings; IS-1 shaping; B-1, B-2, B-3, base units; R-1, R-2, R-3, risers, reducer units; JB-1 and JB-1 A; safety slabs; spring boxes, SB-1; RM-1 right of way monuments; VB-1 valve manholes; SWM-1 storm management; SMH-1 sanitary manholes; and cable concrete erosion control systems.

The following classifications of miscellaneous precast products, such as: 1) Manholes, 2) Box Culvert Systems, 3) Drainage Structures, 4) Barriers (including temporary traffic barriers), 5) Retaining Walls, 6) Sound walls, 7) R/W monuments and 8) other Precast Concrete Products upon approval by VDOT, may be accepted on the manufacturer’s certification based on the requirements of the VDOT Precast Concrete
Products Quality Assurance Program as outlined below. (Temporary precast traffic barrier service shall be visually accepted at the project site for cleanliness, structural integrity, and functionality).

Approved and reviewed drawing will be maintained in the plant office and made available to the VDOT QA inspector to compare to the shop drawing (production drawings) used in the fabrication shop. The approved drawing should be present during production for easy reference. Fabrication should not begin until the approved drawings have been reviewed by VDOT QA inspector. The precast facility should allow five business days for review of approved drawings before production begins.

In order to supply miscellaneous precast concrete products to a VDOT project, the precast concrete producer must be on the Materials Division Approved List No. 34. The precast concrete producer may qualify for placement on this list in either of the following ways:

The precast concrete producer shall submit a Quality Control (QC) Plan defining its routine business quality control practices. The QC plan is submitted to the Materials Division Quality Assurance Section. After review for completeness and conformance of the producer’s QC plan to the Quality Control Plan Checklist as found in Appendix H of this chapter, a plant visit will be made to evaluate the producer’s conformance to its QC Plan. If during the inspection deficiencies are noted, this will be documented in a report with a follow-up visit scheduled. If no deficiencies are found, the precast concrete producer will be granted probationary approval.

The miscellaneous precast concrete producer will then be added to the Approved List No. 34 with a “p” to denote the probationary status of the facility.

The probationary status will remain in place for a minimum of six months. After six months and when a precast facility has supplied two consecutive VDOT projects with a quality product without accumulating more than two Non-Conformance Reports (NCR), the probationary status of the facility may be removed by the Quality Assurance Section Manager. If problems are encountered during the production and supply within this probationary period, then additional projects may be necessary for the producer to correct QC Plan conformance issues. After one year, if the precast facility has not supplied two consecutive VDOT projects it will be removed from the approved list. Once the probationary period has been successfully completed, the “p” will be removed from the precast concrete facility on approved list. The Department will continue to monitor the producer’s facility to ensure conformance to the QC plan and project specifications.

Annually, the Department will review the updated QC plan submitted by the producer and update the Approved List with the latest review date. Updates such as changes in Quality Control personnel, Management, Plant ownership, Mix designs, or changes in items manufactured shall be communicated to the Quality Assurance Section Manager within three business days and the written QC plan shall be updated within two weeks of these actions. The approving/revoking authority is the Quality Assurance Section Manager. Appeals must be submitted to the State Materials Engineer for final disposition.

Each approved facility must have at least one Precast Concrete Quality Control (QC) Technician on staff responsible for ensuring that the QC plan is being followed. To qualify as a Precast Concrete QC Technician, one has either: a) current VDOT Concrete Plant and Field Certifications which include an American Concrete Institute’s Concrete Field Testing Technician Grade I certification or b) a National Precast Concrete Association Production and Quality School Level I Technician certification, an American Concrete Institute’s Concrete Field Testing Technician Grade I certification, and VDOT Concrete Plant Certification. Each QC Technician must have a unique quality control stamp for approval of work and documented in QC plan. VDOT specifications and policies over-ride other plant certifications or specifications denoted in the third-party plant certification.
Note 1: In extraordinary circumstances, production personnel may be substituted for QC Technician involved in some quality control activities on a limited basis. The substitute QC Technician is only authorized to be used in this capacity no more than five days in a month and only in order to meet the quality objectives. Production personnel acting in this capacity shall not provide the quality audit or review production practices where they are directly involved. These production personnel must be identified on the QC plan.

(1) Testing
The producer shall perform the following minimum quality control procedures, and the statement "We certify that these items have been tested and conform to the VDOT Precast Concrete Products Quality Assurance Program" shall be on each shipping document and signed by a responsible company representative. The shipping document should also contain the following information: The plant name, location, telephone number, document number, contractor’s name, and project number. One additional copy of the shipping document shall be provided to the Central Office Materials Quality Assurance Section for distribution to the District receiving the product.

<td></td>
</tr>
</tbody>
</table>

For the purpose of this program, a lot is defined as a maximum of 250 cubic yards (200 cubic meters) or no more than three consecutive calendar days of production (whichever is less) of precast concrete from each batching operation, being of like material, strength and manufactured by the same process. Variations in lot definition will be governed by applicable specifications and approved by the Quality Assurance Section Manager.

If cylinder strength failure occurs, the lot shall be evaluated by cores. If a core fails, two cores shall be taken to recheck the failed core. Both cores must pass for the lot represented to be acceptable. If both cores do not pass, each unit may be tested individually for acceptance.

Note: The requirements for absorption testing on precast concrete (dry-cast) units are one per lot with no history of test results. If a history of test results is available for a given mix design, then the minimum frequency of absorption testing is as follows:

Frequency of tests = one absorption test per the number of consecutive lots with passing results or a minimum of one test per twenty-five lots of production.
A random sampling process (as defined in the precast concrete producer’s approved Quality Control Plan on file with the Department) will be used to determine the lot from which a specimen will be tested. If a failing result is obtained, the frequency of test will resume at one test per lot as if no history was available.

Examples:

No. 1 – If no history is available, the frequency of testing is one per lot. If this test passes, then over the next two lots, one lot is randomly selected and tested for absorption. If the absorption test passes, then the frequency of testing will be one randomly selected lot out of the next 3 lots. The process may continue in this manner until twenty-five passing results are obtained.

No. 2 – If a precast concrete (dry-cast) producer has 15 consecutive passing test results, then the frequency of absorption tests would be one per 15 lots. If the next random sample test passes, the number of consecutive passing test results increases by one to becomes 16. The process continues in this manner until twenty-five passing results are obtained.

No. 3 – If the number of consecutive passing test results was 35, the frequency of absorption tests would be one per 25 lots. If a failure occurred, then the number of tests would reinitialize to one test per lot.

(2) Test facilities

Producer facilities, equipment and testing personnel shall be adequate to conduct the applicable tests outlined in AASHTO T280, and shall require Department approval. Quality Control procedures shall be performed by or under the direction of a Precast Concrete QC Technician. To qualify as a Precast Concrete QC Technician, one has either a) current VDOT Concrete Plant and Field certifications or b) a National Precast Concrete Association Production and Quality School Level I Technician certification, an American Concrete Institute’s Concrete Field Testing Technician Grade I certification, and VDOT concrete plant certification. The Quality Control person operating the batching equipment (batcher) must pass an annual concrete batching exam developed by the precast facility and identified within QC plan.

Entrained air will be checked with a pressure type meter according to ASTM C231.

Compression cylinders or cores shall be tested with facilities, equipment and personnel sufficient to conduct such tests according to ASTM C39. Compressive strength cylinders may be either 6 inch (150 mm) diameter by 12 inch length (300 mm), or 4 inch (100 mm) diameter by 8 inch (200 mm) length.

Producers shall maintain current calibration certificates on all analytical equipment used in testing.

Producers may elect to use the services of an independent commercial testing laboratory acceptable to the Department in lieu of conducting their own tests.

(3) Shipment

Products may be shipped to VDOT projects under either of the two following conditions:

a) All required testing for all product in the lot has been completed with acceptable results and all of the product to be shipped is at least the age of the test specimens at the time of testing. Acceptable results for shipping are defined as 85% of design compressive strength. Strength testing shall continue until design compressive strength has been attained.
b) Product which otherwise has met all test criteria may be shipped prior to completion of absorption testing if the concrete mix and manufacturing process used have historically produced the required absorption results, and approval is received from the Engineer, with final acceptance pending acceptable results.

(4) Records

All testing and inspection documentation will be maintained at the producing plant for at least five years, and will be made available to Department personnel at their request.

Producers will also collect and maintain conformance certificates and/or mill test reports for aggregates, cement, and reinforcing steel, frames, grates, collars, lids, steps, steel angles, and other applicable components intended for use in products to be used on VDOT projects.

Producers will maintain a Department approved Quality Control Form(s) for each lot, and as a minimum the form(s) will contain the following:

- Plant identification
- QC Technician Signature
- Lot identification
- Production dates
- Number of units and cubic yards (cubic meters) produced for each lot.
- Reinforcement as per specification or approved drawings
  - Type – Corrosion Resistant, galvanized, black
  - Mill Test Reports
  - Buy America certification
- Castings as per specifications
  - Mill Test Reports
  - Buy America certification
- Compressive strength
  - cylinder strength - required/achieved
  - core strength - required/achieved
- Absorption - required/achieved
- Visual inspection performed
- Markings verified
- Dimensions verified: Applicable Specifications
  - Manholes AASHTO M199 (ASTM C478)
  - Box Culverts AASHTO M259 (ASTM C789)
  - AASHTO M273 (ASTM C850)
  - Water and Wastewater Structures (i.e. DI's, JB's, EW's, etc.) (ASTM C913)
- Raw materials
  - current certifications from vendors
- Repair materials - VDOT approved list

In addition to date and other required markings, the plant identification and letters “QC” or “NPCA Certified Plant” shall be affixed to each piece of products. Such markings shall be evidence that the required QC procedures have been performed.

(5) Monitoring

The producer’s production and testing facilities, processes, records, and product will be monitored as deemed necessary depending on project-related work by the Department. A checklist of items to be inspected is provided in Appendix E (Precast Concrete Plant Monitor Report). The checklist will be
completed in its entirety each quarter. If during the VDOT QA Inspector’s inspection, a nonconformance to VDOT specifications, checklist in Appendix E or the producer’s QC plan is observed the QA Inspector will issue a Non-conformance Report to the producer’s QC Technician and plant manager. The Non-conformance Report will list the violation of the QC plan, checklist in Appendix E or specification and rate the violation on a scale of one (1) to five (5). A one (1) is considered a small infraction within a category and is equal to one point and a five (5) is considered a major infraction within a category and is equal to 5 points. Typical Precast Concrete QC violation categories and points per category are listed in Appendix L.

The QA Inspector will work with the producer’s QC Technician in making a resolute effort to resolve non-compliant inspection action items and develop a procedure or process to ensure the violation does not take place again. The accumulation of fifteen nonconformance points or more within a twelve month period will result in the precast facility being placed on probation for six months. If the precast facility accumulates twenty nonconformance points within a twelve month period the facility will be removed from the approved list immediately.

**Appeal Process:**

A precast producer has five business days upon the notification(s) of NCR issued by the QA Inspector that changes the status of the producer on list #34 to appeal to the Quality Assurance Section Manager. The appeal must be in writing. The Quality Assurance Section Manager will follow the steps below:

1. The Quality Assurance Section Manager will review the QA Inspector’s NCR and the precast producer’s documentation within five business days of notification. If the Quality Assurance Section Manager can resolve the matter with the precast producer, there will be no need to proceed to step 2.
2. The Quality Assurance Section Manager will issue a written notice of placing the precast facility on probation for a minimum of six months or removing from the approved list. The Quality Assurance Section Manager’s decision on being placed on probation is final.
3. If the decision is to remove the precast producer from the approved list, the precast producer may appeal the decision in writing to the State Materials Engineer within five business days. The State Materials Engineer (or designated representative) decision is final and will be made within five business days after receiving the precast concrete producer’s written appeal. If the precast facility is removed from the approved list the facility is not eligible for reinstatement for one year from the date of notification.

(6) Annual Quality Testing

Quality testing will be performed as deemed necessary by the Department for establishing quality of raw materials. The tests may be performed on the aggregates, cement, mineral admixtures, and all types and sizes of reinforcing materials.

(7) Repairs

Repairs will be in accordance with The Precast Concrete Repair Manual listed in the Appendix I.

**Sec. 204.23 Monuments, Right-of-Way**

(Sec. 219 and Road Designs and Standards, RM-2) See Sec. 207 for details of acceptance on modified inspection. Concrete right-of-way monuments are inspected and stamped at the plant when practicable. When monuments are received on the job bearing no inspection mark, or when monuments are made on the job by the Contractor, one whole monument shall be submitted to the District or Central Office Laboratory from each project. No container is necessary for shipment, but all required information should be recorded for the monument.
When RM-2 monuments are used, consisting of steel pins and either U-type galvanized rolled rail steel or aluminum alloy locator posts, it will be necessary to secure a sample of one whole cadmium plated brass or stainless steel cap used therewith per project and submit it to the Central Office Laboratory for test. The sample may be shipped in a packaging envelope. Samples of the pins and posts will not be necessary and they may be accepted on visual inspection, since no tests or certification are required.

Each sample shall be marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800. Laboratory tests and inspections of concrete monuments will be reported on Forms TL-29 and TL-109 respectively, as outlined in Sec. 800. Laboratory tests of brass or stainless steel caps will be reported on Form TL-47, as outlined in Sec. 800.

**Sec. 204.24 Paint**

(Sec. 231) Paint shall be mixed thoroughly by stirring or by agitating before the sample is selected. The mixing may be accomplished by mechanical agitation, stirring with a paddle, or by "boxing" the paint. In "boxing" the paint, a clean container is used, and the paint is poured back and forth between the containers until all lumps are broken up and thoroughly dispersed through the paint. Care must be taken to incorporate in the paint all settled pigment from the bottom of the container. At least one quart (one liter) of paint, System A, and AA of each type used (aluminum paste and varnish sampled separately) shall be submitted to the Central Office Laboratory for examination from each lot or batch. Paint, Systems B and F, will be accepted on approved list, and certification. Clean, widemouth metal cans may be used for shipment.

All samples of paint shall be packed and marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800. Laboratory tests and inspections of paint will be reported on Forms TL-47 or TL-47A and TL-109 respectively, as outlined in Sec. 800.

Paint in quantities of 20 gals. (75 liters) or less per project may be accepted on modified inspection, as outlined in Sec. 207.

**Sec. 204.25 Piling**

(Secs. 217, 226(b), 228, and 236) See Sec. 207 for piling that may be accepted on modified inspection.

(a) **Concrete: Cast-In-Place, Precast, or Prestressed**

Sampling of cast-in-place, precast, or prestressed concrete piling shall be in accordance with Sec. 400.

(b) **Steel, H-Beam**

Steel H-beam piling will not require sampling and or mill inspection. It is the responsibility of the Contractor to request 3 copies of the mill analysis, and a packing list showing the number of piles of each length and heat numbers, when placing the order for this material to be delivered directly to the project site. The 3 copies of the mill analysis shall accompany the shipment to the project. The Project Inspector shall compare the heat number on the piles to that stated in the mill analysis, to ensure that the piles are in fact the material represented by the mill analysis. Caution should be exercised to ensure that a mill analysis is present for each heat represented, since many times a shipment will contain several heats. A copy of the packing list shall be transmitted with 3 copies of the mill analysis to the State Materials Engineer by the Project Inspector. See Sec. 207 for additional details on modified inspection.

(c) **Steel, Sheet**

Steel sheet piling shall be approved by mill analysis and packing list, as outlined in Paragraph (b) above.

(d) **Steel, Shell**

Type A and D steel pile shells shall be approved by mill analysis and packing list, as outlined in Paragraph (b) above.
(e) Timber
Timber piles will not require sampling, but will require shop inspection. For treated piles, the preservative and treatment are sampled, as outlined in Secs. 204.29 and 204.33. Untreated timber piles may be accepted on modified inspection, in accordance with Sec. 207.

(f) Reports
Laboratory tests of concrete cylinders for concrete piling will be reported on Form TL-26 (TL-26B, if computerized test report output form). Laboratory tests of preservative treatments for treated timber piling will be reported on Form TL-47. Inspections of prestressed concrete and treated piling will be reported on Form TL-109. See Sec. 800 for details of these forms.

Sec. 204.26 Pipe
(Sec. 232) See Sec. 207 for additional details of acceptance of pipe by modified inspection. (See list of gaskets and coatings in Chapter 7.) When the quantity of any approved type of culvert pipe is 50 ft. (15 m) or less per project, culvert may be accepted on visual inspection. Culvert pipe used on rest area and landscape contracts will be sampled and tested the same as for any other type project.

(a) Acrylonitrile-Butadiene-Styrene (ABS)
ABS semiround underdrain pipe with top shield shall be sampled by cutting one piece a minimum of 2 ft. (0.6 m) in length by full section from one pipe length of each size per shipment. See Paragraph (l) herein for instructions on approval of ABS pipe used in municipal sewer lines.

All samples shall be submitted to the Central Office Laboratory loose, with Form TL-10 attached. The samples shall be marked and shipped, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(b) Cast Iron
Cast iron culvert pipe may be accepted on modified inspection, based on Manufacturer's certification, as outlined in Sec. 207. See Paragraph (l) herein for instructions on approval of cast iron and ductile iron pipe, fittings, and gaskets for use in municipal sewer and water lines.

(c) Clay
Clay pipe shall be sampled by selecting the equivalent of 0.5 percent of the total number of pipes of each size produced each day, with at least one specimen of each size being furnished. Samples for strength tests shall consist of one complete pipe joint. Samples for absorption tests shall consist of a full thickness section cut from the wall of the pipe, and measuring 12 to 20 sq.in. (7,500 to 15,000 mm²) in surface area.

The strength tests will usually be performed at the plant, especially for the larger size pipes. Absorption samples are submitted to the District or Central Office Laboratory, and shall be taken from the same pipe specimens that have been found acceptable in strength requirements. The samples shall be packed and marked, in accordance with Paragraph (a) above.

See Paragraph (l) herein for instructions on approval of vitrified clay pipe and fittings for use in municipal sewer lines.

(d) Concrete
Concrete pipe, conforming to the applicable VDOT Specifications, will be accepted on the manufacturer's certification based on the requirements of the VDOT Concrete Pipe Quality Assurance Program as outlined below. This involves the sampling, testing, documentation and certification of the product by the manufacturer in combination with a Department monitoring program. VDOT reserves the right to discontinue acceptance of concrete pipe in the event that VDOT monitoring efforts indicate that non-specification material is being provided or test procedures are not being followed.
When approving hydraulic cement concrete mix designs for hydraulic cement concrete pipe, the minimum pozzolan additions as outlined in the Virginia Department of Transportation Road and Bridge Specifications, Section 217.02(a) will not be required.

The following types of pipe may be accepted under this program: (1) Concrete Sewer, Storm Drain and Culvert Pipe; (2) Reinforced Concrete Culvert, Storm Drain and Sewer Pipe; (3) Joints for Circular Concrete Sewer and Culvert Pipe using Rubber Gaskets; (4) Reinforced Concrete Elliptical Culvert, Storm Drain, and Sewer Pipe; and (5) Reinforced D-Load Culvert, Storm Drain, and Sewer Pipe.

In order to supply concrete pipe products to a VDOT project, the concrete pipe producer must be on the Materials Division Approved List No. 26. The concrete pipe producer may qualify for placement on this list in either of the following ways:

1. The concrete pipe producer shall submit a Quality Control (QC) Plan defining its routine business quality control practices. The QC plan is submitted to the Materials Division Central Office Quality Assurance Section. After review for completeness and conformance of the producer’s QC plan to the Quality Control Plan Checklist as found in Appendix H of this chapter, a plant visit will be made to evaluate the producer’s conformance to its QC Plan. If during the inspection deficiencies are noted, this will be documented in a report with a follow-up visit scheduled. If no deficiencies are found, the precast concrete producer is probationarily approved.

2. Alternatively, a plant can be probationarily approved if they have a current American Concrete Pipe Association or other plant certification approved by the QA Engineer and submit an abbreviated QC plan. The QC plan shall include at a minimum proof of certification, plant contact information and address, raw materials used, patching materials used, testing frequencies and an example shipping ticket. This document is submitted to the Materials Division Central Office Quality Assurance Section.

The concrete pipe producer will be added to the Approved List No. 26 with a “p” to denote that the facility is probationarily approved.

Each approved facility shall have at least one VDOT certified Precast Concrete technician on staff responsible for ensuring that the Quality Control Plan is being followed. VDOT specifications and policies over-ride other plant certifications or specifications denoted in the third-party plant certification.

When one or more successful projects have been completed demonstrating conformance to the QC plan and that a quality product has been consistently supplied, the probationary status will be removed. If problems are encountered during the production and supply within this probationary period, then additional projects may be necessary for the producer to work out QC Plan conformance issues. Once the probationary period has been successfully completed, the “p” will be removed. The Department will continue to monitor the producer’s facility to ensure conformance to the QC plan and project specifications. Annually, the Department will review the updated QC plan submitted by the producer and update the Approved List with the latest review date. The approving/revoking authority is the Central Office Quality Assurance Materials Engineer. Appeals may be submitted to the State Materials Engineer for final disposition.

(1) Frequency of Testing
The producer will perform the following minimum quality control procedures, and the statement "We certify that these materials have been tested and conform to the VDOT Concrete Pipe Quality Assurance Program." shall be on each shipping document and signed by a responsible company representative.
Test | Minimum Frequency
--- | ---
Plant load bearing tests or Compressive strength | One per lot
Absorption | See note below
Inspection of manufactured product for visual defects and imperfections | Each unit

For the purpose of this program, a lot is defined as a single day’s production of concrete pipe, all being of like size, material, strength designation, and manufactured by the same process. However, if less than 100 units are produced per day, the lot size may include up to 100 units produced in no more than 5 days. The five days need not be consecutive, as long as they occur within a two week period, and the process used is not altered in any way between production days.

If a manufacturing process is used which produces two or more pipe sizes, styles, or classes simultaneously, one set of material tests (compression and absorption) can be used to represent all sizes, styles, or classes, provided no change in mix design occurs. Individual load bearing tests, if used as a basis of acceptance, will be required for each size, style or class, according to the guidelines described above.

Note: The requirements for absorption testing on concrete pipe are one per lot with no history of test results. If a history is available, then the minimum frequency of absorption testing may be reduced as follows:

\[
\text{Frequency of tests} = \frac{\text{one randomly selected absorption test per number of consecutive production lots with passing test results or a minimum of one test per 30 consecutive production lots}}{30}\]

A random sampling process (as defined in the concrete pipe manufacturer’s approved Quality Control Plan on file with the Department) will be used to determine the lot from which a specimen will be tested. If a failing result is obtained or if one or more of the source of materials for a mix design changes, the frequency of test will resume at one test per lot as if no history was available.

Examples:

No. 1 - If no history is available, the frequency of testing is one per lot. If this test passes, then over the next two lots, one lot is randomly selected and tested for absorption. If the absorption test passes, then the frequency of testing will be one randomly selected lot out of the next 3 lots. The process continues in this manner until 30 consecutive passing results are obtained. Once 30 consecutive passing tests results are obtained, then, as long as subsequent tests pass and there are no changes in the source of materials for the mix design, the frequency of testing will be one test on a randomly selected lot per 30 lots.

No. 2 - If a concrete pipe manufacturer has 10 consecutive passing test results, then the frequency of absorption tests would be one randomly selected lot out of the next 10 lots. If the next random sample test passes, the number of consecutive passing test results increases by one to becomes 11. Once 30 consecutive passing tests results are obtained, then, as long as subsequent tests pass and there are no changes in the source of materials for the mix design, the frequency of testing will be one test on a randomly selected lot per 30 lots.
No. 3 - If the number of consecutive passing test results was 35, the frequency of absorption tests would be one test on a randomly selected lot out of the next 30 consecutive lots, provided there are no changes in the source of materials for the mix design.

If a failure occurs, then the number of tests would reinitialize at one test per lot.

(2) Test Facilities
Producer facilities, equipment and testing personnel shall be adequate to conduct the tests outlined in AASHTO T280, and shall require Department approval. Quality Control Procedures shall be performed under the direction of a VDOT certified Precast Concrete Technician.

If compression cylinders or cores are used in lieu of three edge bearing tests, facilities, equipment and personnel will be sufficient to conduct such tests according to ASTM C39. Compression cylinders may be either 6 inch (150 mm) diameter by 12 inch (300 mm) length, or 4 inch (100 mm) diameter by 8 inch (200 mm) length.

Producers will maintain current calibration certificates on all analytical equipment used in testing.

Producers may elect to use the services of an independent commercial testing laboratory acceptable to the Department in lieu of conducting their own tests.

(3) Shipment
Products may be shipped to VDOT projects under either of the two following conditions:

(a) All required testing for all product in the lot has been completed with acceptable results and all of the product to be shipped is at least the age of the test specimens at the time of testing.

(b) Product which otherwise has met all test criteria may be shipped prior to completion of absorption testing if the concrete mix and manufacturing process used have historically produced the required absorption results, and approval is received from the Engineer, with final acceptance pending acceptable results.

(4) Records
All testing and inspection documentation will be maintained at the producing plant for at least five years, and will be made available to Department personnel at their request.

Producers will also collect and maintain conformance certificates and/or mill test reports for aggregates, cement, and reinforcing steel intended for use in products to be used on VDOT projects.

Producers will maintain a Department approved Quality Control Form for all pipe produced for VDOT projects. As a minimum, a form for each lot will contain the following:

<table>
<thead>
<tr>
<th>Plant identification</th>
<th>Technician Signature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lot identification</td>
<td>Production dates</td>
</tr>
<tr>
<td>Pipe dimensions</td>
<td>Pipe strength class</td>
</tr>
<tr>
<td>diameter - required/achieved</td>
<td>Number of units produced each date</td>
</tr>
<tr>
<td>length of pipe - required/achieved</td>
<td>Visual inspection</td>
</tr>
<tr>
<td>wall thickness - required/achieved</td>
<td>finish/cosmetic</td>
</tr>
<tr>
<td>joint style - required/achieved</td>
<td>dimensional tolerances</td>
</tr>
<tr>
<td>Reinforcement</td>
<td>wall thickness</td>
</tr>
<tr>
<td>style and spacing - required/achieved</td>
<td>diameter</td>
</tr>
<tr>
<td>area - required/achieved</td>
<td>length</td>
</tr>
<tr>
<td>position of reinforcement - required/achieved</td>
<td>position of reinforcement</td>
</tr>
</tbody>
</table>
adequacy and quality of welds/splices markings
Compressive strength Raw materials
cylinder strength - required/achieved current certifications from vendors
core strength - required/achieved Absorption - required/achieved
Three Edge Bearing
  0.01” (0.03 mm) crack strength - required/achieved
  ultimate strength - required/achieved

In addition to date and other required markings, the plant identification and letters “QC” or “QCast” shall be affixed to each piece pipe and end section. Such markings shall be evidence that the required QC procedures have been performed.

(5) Monitoring

The producers’ production and testing facilities, processes, records and product will be monitored by the Department. Checklist of items to be inspected is included as Appendix A. The checklist must be completed in its entirety each quarter. One size and class of pipe should be selected for three-edged bearing test per month, the sample should be taken at random, the test witnessed for load test compliance, and noted on the monitoring checklist, size, load, crack width, etc. The load shall not be taken to ultimate strength, if the sample pipe passes D-Crack Load criteria.

(e) Corrugated Metal Pipe

Corrugated metal pipe conforming to the applicable VDOT specifications will be accepted on the manufacturer's certification based on the requirements of the VDOT Corrugated Metal Pipe Quality Assurance Program as outlined in paragraph (f). This involves the sampling, testing, documentation, and certification of the product by the manufacturer in combination with a Department monitoring program. VDOT reserves the right to discontinue acceptance of metal pipe in the event that VDOT monitoring efforts indicate that non-specification material is being provided or test procedures are not being followed.

The following types of steel and aluminum alloy pipe may be accepted under this program.

(1) Corrugated metal culvert pipe, pipe arches, and underdrains
(2) Asphalt coated corrugated metal culvert pipe and pipe arches
(3) Corrugated metal end sections and coupling bands

Coatings:

(1) Zinc coated (galvanized)
(2) Precoated (polymeric) galvanized
(3) Aluminum-Zinc alloy coated
(4) Aluminum Coated

(f) VDOT Corrugated Metal Pipe Quality Assurance Program

The manufacturer will perform the following minimum quality control procedures, and the statement "We certify that these materials have been tested and conform to the VDOT Corrugated Metal Pipe Quality Assurance Program" shall be on each shipping document, and signed by a responsible company representative. Records of the following test and inspection procedures will be accessible to VDOT and retained for two years.

Frequency

(1) Maintain file of metal sheet manufacturer's certified Each heat
mill analysis

(2) Sheet or Coil Thickness Measurement
One per heat

(3) Coating Thickness Measurement on Sheet or Coil
One per heat

(4) Pipe dimension:
Pipe - Measurement
Diameter - Measurement
Corrugation Depth - Measurement
Corrugation Width - Measurement
Seams locked and welded - Visual
One per production shift, per spiral
machine, metal, or corrugated depth

(5) Lock seam test - AASHTO T249
Welded seam test - AASHTO T241
One test per spiral machine, per shift, per week

(6) Repair of damaged metallic coating, surface cleaning,
One test per day if applicable
thickness - Visual

(7) Underdrain:
Size of perforation - Measurements
Rows of perforations - Visual
Slotted Drain:
Slot Height - Measurements
Slot Width - Measurements
Bar Thickness - Measurements
Once per day

(8) Asphalt Coated Product:
Asphalt thickness - Measurement
Pavement thickness - Measurement
Pavement width - Measurement
Ten Percent of Production

(9) Arch dimensions - Measurement
Ten Percent of Production

(10) Rivet details
Spacing - Measurement
Diameter - Measurement

(11) Workmanship - Visual
One Hundred Percent

The plant identification and the letters "Q.C." shall be affixed to each piece of pipe and end section. Such marking shall be evidence that the required Q.C. procedures have been performed.

To determine the weight of galvanized coating, thickness may be obtained by means of a magnetic thickness gauge. Four (4) separate readings (2 outside and 2 inside) shall be randomly taken. The outside and inside reading will be added and the average of the two additions must not fall below 3.4 mils (85µm). Thickness measurements are to be converted to weight per square foot (square meter). The average weight of zinc in ounces (grams) per square foot (square meter) as measured will be noted on the inspection report.

Samples may be requested by VDOT for testing of galvanized coating. These samples should be 3 by 6 inch (75 by 150 mm) specimens cut from the sheets, and marked in accordance with Section 203, using Form TL-10, as outlined in Section 800.

Asphalt coating material will be accepted on manufacturer's certification and test reports.

VDOT representatives will randomly conduct a minimum of two plant inspections per year with cooperation and assistance of the fabricator to insure that specifications and quality control requirements are being met. Visual inspection shall be made by the project inspector when the pipe is received on the project.
Normally, the Fabricator will seal each pipe to be dipped with an embossed tag prior to dipping, so as to identify the thickness of the pipe metal after coating. However, when a culvert to be dipped has been fabricated using the minimum thickness that is specified for that particular diameter pipe, then there will be no necessity for an embossed tag to be attached to the culvert. If the bituminous coated corrugated metal culvert arrives at the project site without an embossed tag indicating thickness, project personnel will automatically know that the culvert has been manufactured using the minimum thickness. Manufacturer’s certification will indicate the size, corrugation dimensions, sheet thickness, and coating thickness (if required) for each size and type of pipe shipped.

Standard PC-1 of the Road Designs and Standards specifies the allowable thickness for each diameter pipe. For example, if a 24 in. (600 mm) diameter bituminous coated corrugated metal culvert arrives at the project site without an embossed tag, it would be understood that the thickness of this culvert is 0.064 in. (1.6 mm). If this same size culvert was manufactured using a different thickness metal, then the Manufacturer would be required to attach an embossed tag to the culvert prior to dipping indicating the thickness, in inches (mm).

(g) Glass Fiber Reinforced Epoxy Pipe and Fittings
Glass fiber reinforced epoxy pipe and fittings shall be sampled by obtaining one piece a minimum of 3 ft. (1 m) in length by full section from one pipe length of each size per shipment.

(h) Polyethylene (PE) Corrugated Pipe
Corrugated polyethylene pipe shall be accepted from approved list.

For a pipe to be included on the approved list, the manufacturer must be on a VDOT approved quality control/quality assurance program, as outlined below, or must certify annually that the pipe shipped will come from only preapproved VDOT tested stock. Pipe not covered by an approved quality control/quality assurance plan must be tested. The sample for culvert pipe shall consist of a length equal to 5 diameters for each lot and a lot is not to exceed 5000 lineal feet (1500 meters). For underdrain pipe, a sample shall consist of a piece 5 feet (1.5 meters) in length for each lot of underdrain and a lot is not to exceed 10000 lineal feet (3000 meters).

See paragraph (l) for instructions on approval of polyethylene sewer pipe used in municipal sewer lines.

All samples shall be marked and shipped the same as outlined in Paragraph (a) above.

VDOT PE Corrugated Pipe Products Quality Assurance Program

Producers of Polyethylene (PE) corrugated underdrain pipe, PE corrugated culvert pipe and fittings conforming to the applicable VDOT specifications or special designs approved by VDOT can be placed on the Materials Division’s Approved list of PE suppliers by meeting the requirements of the VDOT PE Corrugated Pipe Products Quality Assurance Program as outlined below.

Quality Control Plan
The producer will submit for VDOT’s approval a Quality Control Plan. The plan must be site specific. The plan must indicate in detail how the Producer proposes to control the equipment, materials, and production methods to insure that the specified products are obtained. The plan must list the personnel responsible for production and quality control at the site.

Identification of the physical location of the plant.

The method of identification of each lot of material during manufacture, testing, storage, and shipment.

The method of sampling and testing of raw materials and of the finished product, including lot sizes and type of tests performed.
A plan for dealing with quality control sample failures. This plan must include how the Producer plans to initiate an immediate investigation and how the Producer will implement corrective action to remedy the cause of the problem.

VDOT will review the Producer's written quality control plan. After approval, an on-site inspection will be scheduled. This on-site inspection will verify that the Producer's quality control plan has been implemented and is being followed. See Appendix A.

If a quality control sample indicates the material or pipe does not meet the specification requirements, the Producer is to initiate an investigation to determine the cause of the failure. The investigation is to include a review of the sampling procedures, the equipment used in the production and the testing of the material, and the testing procedures of the technician. If the cause can be attributed to one of the above categories, the Producer is to take corrective action to bring the material equipment, or procedure into compliance. The Producer is to then record the corrective action on the test report form and take another check sample after the corrections have been made.

If a second quality control sample indicates the material or pipe meets the specification requirements, the Producer may resume normal testing procedures.

If a second quality control sample indicates the material or pipe does not meet the specification requirements, the Producer is to notify VDOT and stop the shipment of the affected pipe. The Producer is to continue the investigation into these failures and work with VDOT to determine the cause.

**Testing**

The producer will perform the following minimum quality control test procedures on the polyethylene resins and the completed pipe as outlined in AASHTO M294 and AASHTO M252.

**TEST**

<table>

| C. Fitting and Coupling: |
| Dimensions and requirements |

**MINIMUM FREQUENCY**

For the purpose of this program a lot is considered to be the amount of pipe produced per shift per size or class per machine.

**Test Facilities**

Producer's facilities, equipment and testing personnel will be adequate to conduct the applicable test as outlined in AASHTO M294 and AASHTO M252 and will be approved by the Department.

Producers will maintain current calibration certificates on all analytical equipment used in testing.

Producers may elect to use the services of an independent commercial testing laboratory acceptable to the Department in lieu of conducting their own tests.
Shipment

Products may be shipped to VDOT projects when all required testing in the lot has been completed with acceptable results. Invoices with the statement, "We certify that these PE pipe and fittings have been tested and conform to the VDOT PE Corrugated Products Quality Assurance Program" shall be on each of the shipping documents and signed by a responsible company representative. One additional copy of the shipping document shall be provided to the monitoring District Materials Section for distribution to the receiving district.

Records

All testing and inspection documentation will be maintained at the producing and the shipping facility for at least two (2) years, and will be made available to Department personnel at their request.

Producer will maintain a Department-approved quality Control Form(s) for each lot, and as a minimum the form(s) will contain the following:

- Plant Identification
- QC Technician's Signature
- Lot Identification
- Production Dates
- Tubing/Pipe Dimensions
- Workmanship
- Perforation Dimensions
- Pipe Stiffness
- Pipe Flattening
- Elongation
- Environmental Stress Cracking
- Brittleness
- Low Temperature Flexibility
- Markings

Applicable specifications AASHTO M252 and AASHTO M294 and VDOT Road and Bridge Specifications and Standards.

Monitoring - VDOT representatives will randomly conduct a minimum of two plant inspections per year with cooperation and assistance of the fabricator to insure that specifications and quality control requirements are being met. VDOT representatives will take random Independent Assurance Samples during the semi-annual inspection at the rate of one sample per size in stock or production. Failure to perform all the program requirements may result in a producer being removed from the Approved List. When the pipe is received on the project, the project inspector shall perform a visual inspection.

(i) Poly(Vinyl Chloride) (PVC) Plastic Pipe and Fittings

This shall be sampled by obtaining one piece a minimum of 3 ft. (1 m) in length by full section from one pipe length of each size per shipment. Fittings may be accepted on modified inspection, as outlined in Sec. 207, since these require no testing or certification. However, fittings should be visually inspected to assure that proper connection can be made.

Semi-round PVC plastic underdrain pipe with top shield shall be sampled by cutting one piece a minimum of 2 ft. (0.6 m) in length by full section from one pipe length of each size per shipment.

See Paragraph (i) herein for instructions on approval of plastic water pipe and fittings used in municipal water lines.

All samples shall be marked and shipped the same, as outlined in Paragraph (a) above.
(j) **Seamless Steel, Black and Galvanized, and Smooth Wall Steel**

Black and galvanized seamless steel pipe shall be sampled the same as "Metal Conduit", as outlined in Sec. 204.14(b), except that black seamless steel pipe will only require one sample, 22 inches (0.3 m) in length, cut from one end of one length of pipe, for each size diameter per shipment. Fittings may be approved on Manufacturer's certified analysis, including zinc coating, as outlined in Sec. 207.

Smooth wall steel pipe used for jacking will not require sampling and testing. This may be accepted on Manufacturer's certification, together with receipt of the physical and chemical analyses, as outlined in Sec. 207.

See Paragraph (l) herein for instructions on approval of steel, galvanized steel, and steel encasement pipe and fittings used in municipal sewer and water lines.

All samples shall be marked and shipped the same, as outlined in Paragraph (a) above.

(k) **Structural Plate Pipe, Pipe-Arches, and Arches**

Structural steel plates and aluminum alloy structural plates for field bolted pipe, pipe arches, and arches shall meet AASHTO M167 or M219. Material will be accepted on mill certification.

(l) **Pipe for Use in Municipal Sewer and Water Lines**

Pipe for use in installation, relocation, and or adjustment of municipal sewer and water distribution facilities will not require sampling and testing. This pipe may be accepted on Manufacturer’s certification or catalog cuts (in certain cases), as outlined in Sec. 207 for each Manufacturer/Supplier for all quantities.

Pipe and appurtenances to be considered under this provision shall include, but not be limited to, the following:

<table>
<thead>
<tr>
<th>Type of Pipe or Appurtenance</th>
<th>Specification</th>
</tr>
</thead>
<tbody>

</tbody>
</table>
Steel Pipe Cement Mortar Protective Coatings & Linings - AWWA: C205.
Valves - AWWA: C 500, C504, or C507.
Water Meters - AWWA: C700, C701, C702 or C703.

**Plant Inspections**

In addition to the inspection of pipe, inspections may also be made of the concrete and corrugated metal pipe plants by Central Materials personnel, as directed by the State Materials Engineer.

Each Department Representative at a concrete pipe plant will submit to the Central Office Laboratory annually a sample of cement, fine aggregate, coarse aggregate, and wire reinforcement used in the production at the particular plant. These samples should be marked as "annual quality tests", and actual submission of samples should be staggered to such a degree that the sampling will not occur on the same date each time. These samples will be used for checks on conformance to specifications. Copies of the test results will be forwarded to the District Materials Engineer and the Plant Inspector for their files.

**Reports**

Normally, all pipe for culverts will be 12 in. (300 mm) and above in diameter. After any of this pipe is inspected and found to be satisfactory, each section of pipe shall be stamped or have a seal secured to the end of the pipe as evidence of inspection. The inspection report, Form TL-109, issued by the Plant Inspector, manufacturers certification, or the inspection report issued by a commercial testing agency, should show certain specific information regarding the pipe, which should also agree with the information shown on the laboratory test report, if any, issued for the particular lot of pipe.

Normally, all pipe for sewers, drains and miscellaneous purposes will be less than 12 in. (300 mm) in diameter. For this reason, it will be impractical or impossible for the Plant Inspector in many cases to seal or stamp each individual section of pipe. Of course, where possible, the pipe should be sealed or stamped. However, if this is impossible or impractical, then some method should be used to indicate to the Project Inspector that the load of pipe received has been tested, inspected, and approved.

Form TL-9 may be used for this purpose and should accompany each load of pipe to the job site, as outlined in Sec. 800. The card should show the exact type of pipe in the shipment, the nominal diameter, total length of pipe in the shipment, and the number of sections in the shipment.

In either case, whether the shipment is for use in culverts or in sewers, drains, or miscellaneous, an inspection report, Form TL-109, or similar report from a commercial testing agency, should be issued by the Plant Inspector covering the shipment of pipe in more detail, as outlined in Sec. 800. The information to be included on Form TL-109 or inspection report, in addition to the usual information, such as date shipped, carrier number, seal number or inspection stamp, and identification, should include such applicable descriptions as length, type, class, strength, diameter, rise, span, thickness, etc. Any miscellaneous couplings, fittings, connections, or end sections included in the shipment should be shown on Form TL-109 in units of each.

**Sec. 204.27 Reserved**

(Previously Plank, Premolded Asphalt.)

**Sec. 204.28 Poles and Posts**

(Secs. 221, 242.02, and 700.02) See Sec. 207 for details of acceptance of poles and posts on modified inspection.

(a) Fence, Chain-Link

Shall be accepted as outlined in Sec. 204.16.
(b) Fence, Standard

(1) Metal Posts and Braces
Shall be accepted as outlined in Sec. 204.16.

(2) Wood Posts and Braces (Treated)
Treated wood fence posts and braces for standard fence normally will not require sampling on the project. The preservative treatment shall be accepted on certification as outlined in Section 204.29 and Section 204.33. Locust posts require no treatment, testing, or certification. See Sec. 207 for additional details of acceptance of wood posts on modified inspection.

(c) Guardrail

(1) Concrete Posts
Concrete guardrail posts shall be sampled by obtaining a specimen of the concrete during the manufacture of the posts. Three (3) concrete cylinders 4 in. (100 mm) in diameter and 8 in. (200 mm) in height shall be molded at the place of fabrication, in accordance with the procedure outlined in Sec. 400. At least one set of 3 cylinders shall be made each day during which posts are being fabricated. The cylinders shall be submitted to the District or Central Office Laboratory after having been properly cured in the same manner as the concrete posts.

Cylinders should be packed and marked, in accordance with Sec. 203, using Form TL-13, as outlined in Sec. 800.

(2) Steel Posts
Steel guardrail posts and steel guardrail offset blocks will be accepted by visual inspection with annual certifications from the Suppliers or Erectors, as outlined for steel beam guardrail in Sec. 204.18. See, also, Sec. 207 for additional details of modified acceptance. It will be necessary that District personnel obtain check samples consisting of a minimum of one whole post and offset block, selected once each 6 months per construction District, and submit to the Central Office Laboratory for testing. This sample normally is taken at the project.

All samples of posts and offset blocks shall be marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800. No container is necessary.

(3) Wood Posts
Treated wood guardrail posts will be handled the same, as outlined in Paragraph (b)(2) above.

(d) Lighting Standards, High Mast Lighting Standards, Luminaires, Mast Arm Poles, Combination Mast Arm-Luminaire Arm Poles, Pedestal Poles, and Other

(1) Aluminum
Aluminum poles, including breakaway, for use as any of the above noted types of poles, will be accepted on modified inspection, as outlined in Sec. 207. The Manufacturer shall certify that the product meets the noted AASHTO specification. Also, if poles are required to meet certain alloy specifications, such as ASTM, then a Manufacturer's certified physical and chemical analysis is required. The above requirements also apply to aluminum alloy breakaway support couplings.

(2) Steel
Steel poles, including breakaway, for use as any of the above noted types of poles, shall be accepted the same, as outlined in Paragraph (d)(1) above. This includes steel shafts and base flanges for high mast lighting standards. See also Sec. 204.32 for additional details of modified acceptance.
(e) Traffic Sign

(1) Aluminum Alloy Poles and Breakaway Supports
Aluminum alloy sign poles, including breakaway supports, are approved on Manufacturers' certified physical and chemical analyses. See Sec. 207 for additional details of acceptance on modified inspection.

(2) Galvanized Steel Sign Poles and Posts
Galvanized steel sign poles and posts shall be approved for use on Manufacturers' mill analyses and shop inspection, as outlined for modified inspection in Secs. 204.32 and 207 herein. If poles or posts are painted, the paint shall be accepted as outlined in Sec. 204.24.

(3) Rolled Rail Steel Poles and Posts
Rolled rail steel sign poles and posts shall be approved for use the same, as outlined in Paragraph (e)(2) above.

(4) Structural Steel Poles and Posts
Structural steel sign poles and posts shall be approved for use the same, as outlined in Paragraph (e)(2) above.

(5) Treated Wood Poles and Posts
Treated wood sign poles and posts shall be accepted as outlined in Section 204.29 and Section 204.33.

(f) Traffic Signal

(1) Steel Poles
Steel traffic signal poles shall be approved for use the same, as outlined in Paragraph (e)(2) above.

(2) Treated Wood Poles
Treated wood traffic signal poles shall be accepted as outlined in Section 204.28(e)5 above.

(g) Reports
Laboratory tests of concrete cylinders for concrete guardrail posts will be reported on Form TL-26 (TL-26B, if computerized test report output form), tests of steel guardrail posts on Form TL-25, and tests of chain-link and metal fence posts and preservative treatments for treated wood posts on Form TL-47. Inspections of all posts will be reported on Form TL-109. See Sec. 800.

Sec. 204.29 Preservatives, Timber
Wood treatment conforming to the applicable VDOT specifications will be accepted on a certification from a wood treatment facility on approved list (#45).

Wood treating facilities must meet the following requirements in order to be placed on the approved list and supply VDOT:

1. The facility shall certify the treatment of their product according to AWPA Standards.

2. The wood treating facility shall allow VDOT or representative to enter facility for the inspection of wood treatment processes, wood testing (wood boring, penetration and retention) and to obtain copies of test results and quality control procedures.

Approved List (#45) Requirements – The wood treating facility must meet the following requirements listed below to be placed on the Approved List. VDOT reserves the right to modify these requirements on a case by case basis.
The facility shall maintain a current AWPA membership and participate in a third party inspection program. (For example: TPI, SPIB, etc.)

**Initial Requirements** - Samples of wood from 10 separate and varied retentions shall be tested for penetration and retention by the wood treatment facility. Retention shall be tested per AWPA A9 (X-Ray Fluorescence Spectroscopy). These samples and the test documentation shall be sent to VDOT Central Laboratory for analysis. VDOT Central Laboratory may analyze the treated wood samples; compare lab results, and review treatment facility inspection reports and documents. Once approved, the wood treatment facility will be notified and shall be placed on the Approved List (#45).

**Annual Monitoring Requirements** - Each wood treatment facility on the Approved List (#45) will be evaluated at least annually for the initial requirements listed above. However, boring samples and test results from 2 separate retentions will be tested by the facility and sent to the VDOT Central Laboratory for analysis. If monitoring results are accepted, the treatment facility will remain on the approved list. If problems in the facility or with sample testing are discovered, VDOT will notify the facility of the problems and attempt to resolve them. If resolution cannot be made, the facility will be removed from the approved list. Re-approval of the wood treatment facility will be allowed at VDOT Central Laboratory’s discretion. Records of the monitoring testing shall be kept on file at the wood treating facility for three years.

**Batch/Charge Testing Requirements** – If the wood treatment facility is not on the Approved List (#45), batch/charge testing is required. VDOT or representative will observe the taking of 10-20 boring samples and the testing for penetration and retention. The ground wood samples will be forwarded to VDOT Central Laboratory. The Central laboratory will test the samples and compare the results with those obtained by the facility. If the specifications are met, that batch/charge will be accepted. VDOT reserves the right to modify these requirements on a case by case basis.

**Certification Requirements:**

The wood treating facility will furnish a certification on each (Charge, PO, Batch No.) or shipment of material. The certification shall include a description of the wood items being treated, the quantity, type of preservative used, retention and the consumer use category.

Example: 12 10”Butt 40’ Piles CCA Retention = 1.0 UC4C  
20 4x4x12’ Posts CCA Retention = 0.40 UC4A

The certification should also contain the following certification statement.

“Name of Manufacturer certifies that the treated wood products for (Charge, PO and Batch No.) have been treated in accordance with AWPA standards, Section 236 of the VDOT Road & Bridge Specifications and meets the applicable minimum penetration and retention requirements.”

**Sec. 204.30 Reflective Materials**

(Secs. 231, 234, 235, 246, and 701) See Sec. 207 for acceptance of reflective materials on modified inspection procedures.
(a) Pavement Markings

(1) Sampling, Testing and Approval

Sampling of reflectorized pavement markings, including glass beads, in the field will not normally be necessary. This material is normally pre-sampled and pre-tested. Materials sampled at the point of manufacture should arrive at the job site or storage area with evidence of test as outlined below. If no such evidence is present, then representative samples need to be taken and shipped to the Central Office Laboratory, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(a) Glass Beads

Glass beads are either dropped on or premixed into pavement markings. Drop-on glass beads are accepted under the Glass Bead Batch Sampling/Testing Plan or the Virginia Glass Bead Acceptance Plan (VGBAP). Glass Beads that are pre-mixed in pavement markings are accepted under Glass Beads Pre-mixed in Pavement Marking Material.

I. Glass Bead Batch Sampling/Testing Plan - Each batch of glass beads are sampled at the point of manufacture by either a VDOT representative or by the manufacturer and forwarded to the VDOT Central Office, Materials Division, Chemistry Lab for testing and acceptance. Batch sampling methods shall follow VDOT Batch Sampling Guidelines (Section 5) and shall include a composite sample that is representative of the entire batch. The composite sample shall be split with the manufacturer retaining half and the other half being sent to VDOT.

The Manufacturer shall test their split sample and forward their results to VDOT Central Office, Materials Division, Chemistry Lab. VDOT will test their split sample per VDOT Testing Requirements (Section 5), assign a sample number (MS #) to the glass bead sample, and notify the manufacturer of the test results prior to shipment.

In addition to the batch sampling/testing plan, the manufacturer shall comply with AASHTO M247 requirements for lead and arsenic testing and limits as described in MAP-21 Requirements (Section 4).

Each batch shipped to VDOT will be accompanied by a Certified Test Report that contains the following information:

(a) Manufacturer's name and address
(b) Batch, pallet, and bag numbers sampled and tested.
(c) Quantity represented
(d) Manufacturer’s test results
(e) VDOT, MS #
(f) Certification statement shall read as follows:

"(Manufacturer Name) certifies that the glass beads produced for VDOT in batch (batch number) have been sampled, tested, and approved by VDOT, Central Office, Materials Division, Chemistry Lab as indicated by laboratory test number, MS#__________. We also certify that this batch conforms to AASHTO M247 including the total concentration limits for Lead and Arsenic."
Each Certified Test Report shall be forwarded to the following:

1. VDOT, Central Office, Materials Division, Chemistry Lab
2. Striping Contractor

Non-Compliance to Specification

Any discrepancies in sampling, test results, and certifications will be reported to the glass bead manufacturer for resolution. VDOT reserves the right to test glass beads from the field in order to verify quality. If test results from the field or the batch sampling plan are found to be out of compliance with VDOT specifications, VDOT reserves the right to discontinue acceptance of glass beads from any manufacturer.

2. Virginia Glass Bead Acceptance Plan (VGBAP) - This plan involves initial testing and verification of glass bead quality. Once approved, the glass bead manufacturer will be placed on the Approved List #76 and will not be required to submit a sample to VDOT from each batch. However, the manufacturer shall continue to test each batch for quality and certification purposes.

   The manufacturer shall submit a monthly monitor sample and a certified test report for that monitor sample. In addition, a certified test report shall be sent to VDOT Central Office, Materials Division, Chemistry Lab for each batch produced for VDOT.

   In addition, the manufacturer shall comply with AASHTO M247 requirements for lead and arsenic testing and limits as described in MAP-21 Requirements (Section 4).

VGBAP Qualification Testing – For initial testing and approval, the manufacturer shall submit 5 separate, non-consecutive batch samples to VDOT for testing. Each batch sample shall be a composite sample selected from the batch per VDOT Batch Sampling Guidelines (Section 5).

   From the two, 1 - quart split samples obtained, one quart shall be tested by the manufacturer and the other quart shall be sent to VDOT for testing. VDOT will test their split samples per VDOT Testing Requirements (Section 5).

   VDOT will test the 5 batch samples and review the manufacturer’s test results. When test results are approved, VDOT will place the glass bead manufacturer on the VGBAP Approved List # 76.

Following approval under the VGBAP, the manufacturer shall certify each batch produced for VDOT by providing a Certified Test Report that contains the following information:

   (a) Manufacturer's name and address
   (b) Batch, pallet, and bag numbers sampled and tested.
   (c) Quantity represented
   (d) Manufacturer's test results
(e) Certification statement shall read as follows:

"(Manufacturer Name) certifies that the glass beads produced for VDOT in batch (batch number) meet VDOT Road and Bridge Specifications, Section 234. We also certify that this batch conforms to AASHTO M247 including the total concentration limits for Lead and Arsenic."

Each Certified Test Report shall be forwarded to the following:

1. VDOT, Central Office, Materials Division, Chemistry Lab
2. Striping Contractor

The manufacturer shall maintain a file of certified test reports for all glass bead batches shipped to VDOT facilities or batches shipped to contractors that perform work for VDOT. These reports shall be retained by the manufacturer for a minimum of 12 months and are to be readily available for verification by VDOT personnel.

Monitor Sample - When the glass bead manufacturer is approved and added to the Approved List # 76, each batch produced will not need to be sampled and tested by VDOT. Instead, a monthly monitor sample shall be taken by the manufacturer from a random batch produced for VDOT per VDOT Batch Sampling Guidelines (Section 5). One of the split samples shall be tested by the manufacturer and the other split sample shall be sent to VDOT for testing along with a copy of the manufacturer’s certified test report. VDOT will test their split of the monitor sample, compare results against the manufacturer’s results, and review the certified test report.

Non-Compliance to Specification

Any discrepancies in sampling, test results, and certifications will be reported to the glass bead manufacturer for resolution. VDOT reserves the right to test glass beads from the field in order to verify quality. If test results from the field or the monitor program are found to be out of compliance with VDOT specifications, VDOT reserves the right to remove the manufacturer from the approved list or discontinue acceptance of glass beads entirely.

3. Glass Beads Pre-mixed in Pavement Marking Material

If a pavement marking material contains incorporated glass beads (Example- Thermoplastic, Preformed Tape, Reflective optics containing glass beads) the manufacturer of that pavement marking material shall comply with AASHTO M247 requirements for lead and arsenic testing and limits as described in MAP-21 Requirements, (Section 4).

Batch Certification Requirements – The pavement marking material manufacturer shall provide written certification for each batch that their glass bead materials meet the MAP-21 testing requirements and limits for Lead and Arsenic. The certification statement shall read as follows:

"(Manufacturer Name) certifies that the glass beads used in (Manufacturer’s name and Product) (batch number) conform to AASHTO M247 total concentration limits for Lead and Arsenic."
This certification statement can be combined with other batch certification documentation and shall be forwarded to the following:

1. VDOT, Central Office, Materials Division, Chemistry Lab
2. Striping Contractor

4. MAP-21 Requirements:

The MAP-21 program for glass beads (Section 1504) requires glass beads used in pavement markings to contain no more than 200 ppm Lead or Arsenic, as determined in accordance with EPA testing methods 3052 and 6010B, or 3052 and 6010C.

(a) Periodic Testing Requirements - VDOT requires glass bead manufacturers or manufacturers of pavement marking products containing glass beads to submit a sample (from a batch being shipped to VDOT) to a VDOT approved, independent, third party lab for lead and arsenic testing as described above. The manufacturer shall provide a 1-quart split of this sample to VDOT for their testing.

The manufacturer shall also allow VDOT or its representative to obtain samples of glass beads per VDOT Batch Sampling Guidelines (Section 5). If VDOT obtains the sample, they will forward the sample to an approved lab for lead and arsenic testing as described above (See Note 1). The split sample may be forwarded to the manufacturer, if requested.

The sampling party (VDOT or Manufacturer), testing frequency and batch sample identification shall be as directed by VDOT.

Results of lead and arsenic testing shall be submitted to VDOT, Central Office Materials Division Chemistry Lab for review within 30 calendar days of sampling.

(b) Batch Certification Requirements - Additionally, all glass bead manufacturers or manufacturers of pavement marking products containing glass beads shall submit (with each VDOT batch), a written certification that their glass bead materials meet the MAP-21 testing requirements and limits for Lead and Arsenic. The required certification statements are included in the plans listed above (Section 1, 2, or 3).

(c) Raw Material Change Requirements - If the raw material source for their glass beads should change, the glass bead manufacturer or the manufacturers of pavement marking products containing glass beads shall advise VDOT within 30 calendar days and allow for sampling and testing as described in Section (a) above.

Note 1:
The glass bead manufacturers or manufacturers of pavement marking products containing glass beads shall arrange for payment to the VDOT approved, independent, third party lab for the MAP-21 testing and reporting to VDOT, Central Office Materials Division.
5. VDOT Batch Sampling Guidelines and Testing Requirements

VDOT Batch Sampling Guidelines:

A batch is normally defined as approximately 44,000 pounds of glass beads or 880, 50 pound bags. Standard sampling protocol requires the cube root of the total number of bags to be sampled. The cube root of 880 is approximately 10. Therefore, 10 random bags from a 44,000 lb. batch need to be selected. The 10 bags will be opened, split down using a splitter and combined until two, 1 quart samples are obtained. The two samples shall be labeled with the manufacturer’s name, date of sampling, and batch number. While some manufacturers pull sample aliquots of different quantities, it is recommended that the ratio described above be followed.

VDOT Testing Requirements:

VDOT glass beads shall conform to the requirements of AASHTO M 247 which requires testing per AASHTO T 346. This includes - Glass Bead Roundness, ASTM D1155, Procedure B; Glass Bead Sieve (Grading) Analysis, ASTM D1214; Glass Bead Moisture Resistance, AASHTO T346. If glass bead manufacturers use test methods different from VDOT and testing results are disputed, manufacturers shall meet VDOT specification while being tested per VDOT test methods listed above. VDOT or its representative reserves the right to inspect the manufacturer’s test equipment, procedures, and quality control program.

(b) Traffic Paint

Traffic paint shall be sampled the same as "Paint", as outlined in Sec. 204.24.

(c) Thermoplastic

Block type thermoplastic marking materials will require 1 block sampled and tested at the Central Office Chemistry Laboratory. Granular materials will be sampled by splitting to obtain a 1 quart (1 liter) sample for testing by the Chemistry Laboratory.

(d) Preformed Tape

Approved List

(e) Polyester Resin

Polyester shall be sampled the same as "Paint", as outlined in Sec. 204.24, except that the catalyst will not be sampled.

(f) Epoxy Resin

Epoxy resin shall be sampled the same as "Paint", as outlined in Sec. 204.24, except that both components shall be sampled.

(2) Acceptance

(a) After appropriate testing has been completed, the manufacturer of the material will attach a certification to their shipping documents similar to one of the following:

Certification I
We certify that our product (batch or lot number) on invoice number ______ or shipping ticket number ______ has been sampled, tested, and approved by VDOT Materials Division as indicated by Laboratory Test Number, MS ______, or by an approved Quality Control Plan as indicated by its unique test number ______.

Certification II

We certify that our product has been tested, approved, and is currently on a qualified products list. We certify that our (batch or lot number) on invoice number is the same product that was tested and approved. Indicated on the shipping document will be the test number from the approved list.

All related materials such as primers, sealers and adhesives for use with the markings shall be included on a shipping ticket covered by one of these certifications.

The individual pavement marking items will require certifications as indicated below:

A. Construction Pavement Markings

Type D - Tape (removable)          Certification II
Type E - Tape (Black, removable)   Certification II
Type F – Paint (Temporary)         Certification I
Glass Beads                        Certification I

B. Permanent Markings

Type A – Paint                      Certification I
Type B
  Class I – Thermoplastic           Certification I
  Class III – Epoxy                 Certification I
  Class IV – Tape (flat)            Certification II
  Class VI – Tape (profiled)        Certification II
Glass Beads                        Certification I

(b) Materials shipped directly from the manufacturer for use on a specific project, and materials shipped to a central storage site for use on multiple projects shall be tracked by an inventory tracking program maintained by the contractor. The program shall be under the control of the contractor who will keep a running inventory of all pavement marking materials shipped from that inventory, including all related materials such as primers, sealers and adhesives used in the application.

A Pavement Marking Materials Inventory Ledger form (see sample form Appendix F) shall be used to record all shipments to and from the Contractor's stock. A separate Pavement Marking Inventory Ledger shall be maintained for each type of material and for each manufacturer. All ledger entries shall be substantiated by manufacturer shipping documents which shall include the Certification I or II statements. Ledger entries for materials received into stock shall indicate quantity, units, date of receipt, manufacturer's lot or batch number, VDOT or other appropriate test numbers and balance on hand. When materials are taken from inventory for shipment to a project, ledger entries shall include quantity shipped, units, project number, date shipped, and balance on hand. All ledger entries shall be initialed by the contractor and such initials certify that all entries are accurate and correct.

Contractor’s Daily Log and Quality Control Report (C-85)

The Contractor’s Daily Log and Quality Control Report is used to track the contractor’s pavement marking materials shipped and installed, quantities, certification information, sample test numbers (MS No’s), work completed (locations) and QC test results. The C-85 form shall have the statement "Materials shipped under this certification have been tested and approved by VDOT as indicated by laboratory test numbers listed
hereon." The C-85 form shall be reviewed and signed by the Contractor and the VDOT inspector on a daily basis.

Monitoring-The Materials Industrial Technician will perform periodic inspection at the pavement marking contractor's storage site and of project records to ensure that the records are being kept in compliance with the above. For those projects where the material is shipped directly to the project, the inspector shall contact the Materials industrial technician for monitoring the use of material. The Materials industrial technician shall be given free access to all files used in the tracking program and provided with copies of any documents from such files as may be requested. If the Materials industrial technician determines that material is untested or needs to be retested, samples shall be taken at the appropriate rate and forwarded to the Central Office Materials Laboratory. The contractor shall not ship material in question until appropriate test coverage is obtained.

The Materials industrial technician will be responsible for obtaining a copy of each C-85 and making distribution to the receiving District Materials Engineer.

(b) Pavement Markers and Delineators
Pavement markers and delineators will be accepted on approved list.

(c) Retro-reflective Sheeting
Retro-reflective sheeting for use on sign blanks, will not require sampling in the field. Retro-reflective sheeting for use on barricades, and channelizing devices shall be accepted on visual inspection. This is approved upon receipt of Manufacturer's Certification. See also Sec. 207 for additional details on acceptance on modified inspection.

Sec. 204.31 Soils and Granular Materials
(Secs. 207 and 208) Soils and granular materials shall be sampled, as outlined in Sec. 300.

Sec. 204.32 Steel
(Secs. 212.02(j), 223, 224, 225, 226, 227, 238, 701, 703, and 705) See Sec. 206 for Independent Assurance sampling requirements. See Sec. 207 for steel that may be accepted on modified inspection.

(a) Castings, Forgings, and Shafting
Steel, ductile iron, or malleable castings and steel forgings and shafting will be sampled and tested at the point of manufacture. Certified physical and chemical analyses of these tests submitted to the Materials Division will be the basis of approval, and visual inspection in the field will be all that is required, as outlined in Sec. 207. See also Sec. 207 for exceptions to the above in cases where cast steel, ASTM A27, and cast iron (gray), ASTM A47 are used in rest area construction.

Gray-iron shall be accepted from Gray Iron Casting Manufacturers/Distributors on QA/QC Program (Approved List 61). Under this, program manufacturers/distributors will have approved Quality Assurance Plans, which define how they intend to maintain all shipping records, inventory records, test report numbers, and other documents needed to assure that materials shipped have the proper acceptance documentation. The Plan will define the responsible parties, and describe when, where, and how the records are maintained. The Quality Assurance Plan will be reviewed for content by the Central Office, Quality Assurance Section. The Quality Assurance Engineer is responsible for the acceptance or rejection of the Quality Assurance Plan in accordance with the Gray-Iron Quality Assurance Plan Checklist Found Appendix II-J of this chapter. The Quality Assurance Engineer shall be responsible for the supplier's adherence to the approved Quality Assurance Plan and has the authority to remove non-compliant suppliers from the list. The approved manufacturers/distributors will be added to a list maintained in the Manual of Instructions.
QC Plan Review for Gray Iron Casting Plants/Distributors

Information included in the QC Plan:

- Plant Name
- Location
- Coversheet to Facility
- Last Revision Date
- Statement of Commitment to Quality Control
- Plant Personnel Organizational Chart
  - Plant Manager
  - QC Technician
  - Personnel Qualifications
  - Line of Reporting
- List of items produced under the plan
- Records
  - Types of records kept
  - Retention time of records
- Materials Section
  - Source of Raw materials/Scrap
  - Certifications of materials
- Product Inspection/Verification procedures
- Testing/Frequency performed
- Problem resolution procedure/Status of out of spec castings
- Storage of product
- Shipping of product
- Example of Stamped Delivery Ticket

(b) Grid Flooring

Steel grid flooring will be accepted on the basis of Manufacturer's certification, as outlined in Paragraph (a) above.

(c) Miscellaneous Metals (Timber Connectors)

Steel for timber connectors will be accepted on the basis of Manufacturer's certification, as outlined in Paragraph (a) above.

(d) Prestressing Tendons

Prestressing tendons, consisting of seven-wire stress-relieved strand or stress-relieved wire, shall be sampled in the casting yard by the Department's Representative. One sample shall be submitted to the Central Office Laboratory for each 7 coils used in State work. One sample shall consist of 2 pieces each 6 ft. (2 m) in length and full diameter, and shall be cut from a representative reel in the shipment.

The sample should be attached securely with wire or nails to a straight rigid object, such as a small board of appropriate length, for shipment. DO NOT TIE STRAND OR WIRE IN A TIGHT CIRCULAR LOOP. The specimen shall be marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800. Included on the form, in addition to other pertinent information, should be the reel number from which sample is drawn, the additional reel numbers of all strand represented by the test sample, and the quantity, in lineal feet (meters), represented by these reels. Strand or wire should not be used until the Materials Division has notified the Inspector of the test results.
(e) Reinforcement

(1) Bars, Plain and Deformed
Plain and deformed steel reinforcing bars will be accepted based on certification provided by the fabricator. The certification shall state that the supplied steel is domestic material, and meets the requirements of the specified ASTM designation, including grade number. Test report coverage will no longer be issued by a plant inspector; therefore, the project inspector must insure that all certifications are in order. A certification shall be provided with each shipping ticket or the certification shall be a part of the shipping ticket. The project inspector will forward to the District Materials Engineer, one copy of the document containing the certification.

When epoxy coated bars are furnished, the fabricator is to also supply an additional certification generated by the coater stating that the bars were coated with an epoxy coating which has been VDOT pre-approved (Manual of Instructions - Approved Epoxy Coatings List) and that the coating was applied, inspected, and protected in accordance with AASHTO M-284.

The fabricator is to maintain a file of mill analyses for all heat numbers of bars supplied to a project. Files of mill analyses and certifications are to be maintained for three years after final shipments to a project. These documents are subject to periodic verification by VDOT authorized representatives.

A Monitor sample will be taken by the project inspector with the contractor's assistance consisting of two specimens, 24 inches (0.6 m) in length, of a selected size per project. The bar size selected will be the predominant size, epoxy coated (if available), utilized on all projects containing 5000 lbs. (2500 kg) or more. Bars must be cut, not burned through. The two pieces from each bar shall be fastened together securely, and a sample card (TL-10) attached to each pair of bars which constitute a sample. Each sample of steel reinforcing bar shall be marked, in accordance with Section 203, using TL-10, as outlined in Section 800. Samples shall be submitted to the Central Office Laboratory, unless the District Laboratory is equipped to perform the test. Epoxy coated bars will be tested for thickness of the epoxy coating, and the bond of the epoxy, in addition to other tests performed on the reinforcing steel. Failures will result in increased testing frequencies as deemed necessary by Central Office Materials.

The District Materials Section or the Central Laboratory will perform inspections of the fabricators at least every six weeks, and the epoxy coating facility at least every six months to verify that the quality control procedures are being followed. The inspections will be performed using the check lists in Appendix C and D.

(2) Bars, Longitudinal, for Continuous Reinforced Concrete Pavement
Longitudinal steel bars for continuous reinforced concrete pavement shall be sampled the same, as outlined in Paragraph (e)(1) above with one monitor sample being taken by the project inspector for each two lane miles (three lane kilometers) of pavement.

(3) Couplers
The project inspector with the contractor’s assistance will take one monitor sample consisting of each size bar per manufacturer per project with the coupler installed by the contractor in the field. The overall length of assembly should be at least 4 feet with the coupler being in the center of the assembly. Each sample shall be marked, in accordance with Section 203, using TL-10, as outlined in Section 800. Samples shall be submitted to the Central Office Laboratory for acceptance testing.

(4) Bar Mat
Bar mat may be accepted on certification as outlined in Section 207.02(36)e.
(5) **Spiral Wire**
Spiral wire may be accepted on manufacturer's certification in accordance with (e)(1) with a minimum of one monitor sample per project being submitted for testing. When used at precast or prestressed plants, semi-annual check samples should be submitted.

(6) **Structural Steel**
Structural steel for use as reinforcement will be accepted, as outlined in Paragraph (f) below.

(7) **Welded Wire Fabric**
Welded steel wire fabric (wire mesh) or welded deformed steel wire fabric for use as concrete reinforcement will be accepted by certification as outlined in (e)(1) above with a minimum of one monitor sample submitted when the quantity exceeds 75,000 square feet (7,000 square meters) per project. The sample is to consist of approximately 3 feet square (1 meter square), cut from any part of the roll at random.

The fabric should be securely tied in a flat position between 2 pieces of corrugated cardboard. Each sample shall be marked, according to Sec. 203, using Form TL-10, as outlined in Sec. 800. Samples are to be submitted to the Central Office Laboratory, unless the District Laboratory is equipped to perform the test.

(8) **Supports for Reinforcing Steel**
In bridge deck slabs and slab spans, the lower mat of reinforcing bars shall be supported by the bolster type support and the upper mat by the high chair type support.

Where the Contractor elects to use stainless or galvanized bar supports, the bar supports may be accepted by a letter of certification from the Manufacturer or Supplier certifying that the bar supports conform to the applicable material and coating specification requirements. If such a letter is not available or if it is determined that further testing is necessary, submit one bar support sample per type and manufacturer to the Central Office Laboratory for testing.

Where the Contractor elects to use bright metal bar supports with plastic coated tips, they may be accepted on visual inspection, provided the reinforcing steel will be maintained at its required location and the plastic coating extends at least 0.5 in. (13 mm) above the form surface as specified. In order that plastic tips will not be displaced during installation, the premolded, slip-on tips must fit tightly on the support, and dipped plastic coatings must adhere tightly to the metal.

In Continuously Reinforced Concrete Pavements (CRCP), the contractor shall choose supports that will not sink into the drainage layer. Support shall also be able to support reinforcing steel without deflecting and shall be able to maintain proper position of reinforcing steel according to the plans. The Project Inspector shall submit a sample of the support system along with material certification to Central Office Materials Division/Pavement Design Section for approval.

In the event the Contractor requests to use protective coatings other than those specified, approval may be given at the District level, based on evaluation by the District Bridge and Materials Engineers. Careful consideration should be given to the proposed spacing, the structural capacity of the supports to maintain reinforcement in the required location, and the ability of the supports to resist rusting where the tips are exposed. If the durability or structural capacity is questionable, the Central Office Laboratory should be consulted.

(9) **Rust**
When the use of reinforcing steel is questionable, due to the presence of rust, the following interpretations of the specification will govern:
(1) The light, powdery red rust coating that initially appears on steel is of no serious consequence and can be safely disregarded.

(2) Further development of the rusting stage, as described in Item (1) above, leads to a thick, dark colored scale of rust. This scale, as long as it is tight and not loose, is not detrimental to bond, and therefore, the steel may be used in concrete. It would be well at this point, however, to carefully observe to determine whether or not the flake, in fact, is tight and not loose.

(3) The condition listed in Item (2) above develops to form a loose, flaky scaling which can be detrimental to the bond between the concrete and the reinforcing steel. If this condition occurs, the steel should be cleaned and rechecked for cross-sectional area before use in the concrete. This cleaning operation could be accomplished by brushing either with burlap or steel brushes, or by sand blasting.

The fact that rusted steel, under certain conditions, may be used in concrete should not excuse careless handling and storage of steel.

(10) Verifying Quantity

In order to determine the quantity of reinforcing steel to be used for payment, the following criteria will govern:

Shipping invoice weights may not agree with plan quantities. As long as the test report quantity and the plan quantity agree within the plus or minus one percent, it will not be necessary to correct or check for missing invoice tickets. However, a note should be placed in the project materials notebook which states that the structure has been built in accordance with the plans and that the difference between the pay quantity and the invoice tickets total quantity is assumed to be due to, permissible variations in weight, fabrication tolerances, or in the accuracy of computations.

(f) Structural

Inspection and acceptance of structural steel items generally will be divided into three categories.

(1) Sampling and Testing

The sample shall consist of two bolts, nuts and washers per diameter per project and will be obtained at the source by a representative of the Central Office Laboratory. Manufacturer's Mill Analysis is required to be submitted with sample.

(a) Anchor bolts for railings.

(b) High strength bolts (A325-A490).

(2) Mill Analysis

It is the responsibility of the contractor to request the Mill Analysis when placing the order for structural steel. The following materials may be accepted with Mill Analysis and/or certification as indicated.

(a) Nuts, studs, and washers for use in elastomeric expansion dams.

(b) Corrugated metal deck form and accessories (include Certificate of Compliance).

(c) Weld filler metal accepted from approved list of electrodes and wire flux combinations. See Chapter 7.

(d) Shear studs accepted from approved list of brand names. Chapter 7.

(e) Lighting standards (low level), mast arm poles, combination mast arm-luminaire arm poles, pedestal poles (including breakaway),. See special certification Section 207.
(f) Poles, posts for traffic signals and signs.

(g) Bolts, general use, AASHTO M314 Grade 36 - Visual inspection only. Check for manufacturer's head marking. When quantities exceed 100, sample in accordance with (f)(1) above.

(h) H-Piling - See Section 204.25(b) for details of acceptance.

(i) Anchor bolts, nuts, and washers will be accepted on a Certificate of Compliance provided by the fabricator. The Certificate of Compliance shall state that the steel is of Domestic material (if applicable) and meets the requirements of the specified ASTM/AASHTO designation. The fabricator or supplier shall maintain the material certification for a period of five years from the date of shipment. In addition, when galvanized bolts, nuts, and washers are supplied, the fabricator or supplier shall maintain a certification from the galvanizer stating that the bolts, nuts, and washers were galvanized in accordance with ASTM A153. The certification shall state the weight of the coating in oz/ft² (g/m²) or the coating thickness in mils (mm). The certificate of compliance shall be similar to the certificate for high strength bolts.

(3) Shop Inspection:
The fabricating shop shall obtain the mill analysis from the manufacturer and submit one copy to the shop inspector for review and acceptance. The shop inspector shall submit copies of the inspection report as shipments are made. The inspector shall retain the copy of the mill analysis for record. Three (3) copies of the fabrication inspection reports shall be forwarded to the Structures Section, with one of each forwarded to the District Materials Engineer, Project Inspector and one will be retained by the Structures section. (See Section 207 for details of acceptance of electrical and traffic signal structural elements).

Miscellaneous steel, such as sole and gusset plates, may be fabricated from stock material, providing the Fabricator submits to the shop Inspector one copy of the mill analysis for this material and a letter certifying the material used is actually that which is represented by the analysis. In addition, the letter shall state the amount of miscellaneous steel used, and this amount shall never exceed 10 percent of plan quantities. Distribution of the mill analysis and fabrication inspection report will be the same as outlined previously.

The inspector’s records will be audited a minimum of semi-annually by the Central Office, Structures Section. Approximately 25 percent of the inspector’s records, since previous visit, will be audited.

When placing an order for high strength bolts, the fabricator shall specify the manufacturer to furnish, with each shipment, the test report as indicated in ASTM A325 or A490. Two (2) copies of these reports shall be submitted by the fabricator to the fabricating shop inspector, one of which will be retained by the inspector. Accompanying these test reports will be a Certificate of Compliance, such as the one outlined below, to be submitted by the Fabricator. One (1) copy each of the test reports and certificate of compliance will be submitted by the inspection agency to the Central Office Laboratory Structures Section.

"FABRICATOR'S LETTERHEAD

CERTIFICATE OF COMPLIANCE

We certify that the high-strength bolts:

__________ pcs. _______(Size) Circular Washers

Manufactured by__________________________________________

Meet the requirements of the pertinent project plans, special provisions, and specifications of the Virginia Department of Transportation in all respects to the best of our knowledge and belief. The attached test report represents the last completed set of mechanical tests which were performed by the Manufacturer at the time of our order.

(Signed)________________________

(Title)_______________________"

This certificate is to be signed by a person of authority representing the Fabricator. There will be no necessity for this certificate to be notarized.

The following structures are normally shop inspected at the fabricating site.

(a) Carbon and high strength steel structures:
1. Rolled beam and plate girder bridges, anchors, bearing and diaphragms.
2. High mast lighting standards and anchor bolts.
3. Sign structures and anchor bolts.
4. Building frames.
5. Miscellaneous steel structures involving welding.
6. Corrugated metal pipe.
7. All components of drop inlets (angles, bars, and/or pipes) shall be accepted by the Department's representative from mill analysis submitted by the Fabricator. The units shall be visually inspected by the Department's Representative for conformance with specifications. It will be satisfactory for the Manufacturer to furnish a galvanizing certification that the unit conforms to the specification requirements (2 oz./sq.ft.) (600 g/m²). See Section 207 for provisions for acceptance on modified inspection.

(4) Corrugated Metal Bridge Deck Forms:

The Manufacturer shall submit a certificate of compliance with each individual shipment of material delivered to the project. In lieu of the actual certificate of compliance accompanying the shipment a statement noted on the shipping document, stating that the material conforms to the requirements of the Virginia Department of Transportation, will be acceptable. The Contractor shall be responsible to submit one copy of each shipping document and 3 copies of the Manufacturer's certificate of compliance to the Central Office Laboratory Structures Section. The Contractor may delegate this function to the Manufacturer. The Structures Section will review and submit a copy of the approved certificate of compliance to the District Administrator (District Materials Engineer) and Project Inspector as outlined above for mill analysis. This method of acceptance does not alter the requirement that shop drawings be submitted to the Department for review. In addition, the District Materials Engineer should periodically random sample this material and submit for test to the Central Office Physical Laboratory. The Certificate of Compliance should follow the general outline as shown.

SHIPMENT____________________________________

MATERIAL FOR STRUCTURE_______________________

This material is covered by this Fabricator's certification statement certifying that the materials and methods utilized in the manufacture of the corrugated metal bridge deck forms are in compliance with ASTM A653, Grade SQ40, SQ50, or SQ80, coating designation G165. Supports, closures and other fabricated parts are in compliance with ASTM A653 Grade SQ33, SQ40, SQ50, or SQ80, coating designation G165.

Based on mill certificates, it is certified that representative samples of the listed materials have been tested and that the test results conform to the requirements of noted specifications. Copies of these certified mill test reports are on file and are available to the Virginia Department of Transportation upon request.

Material description covered by this certification statement is as shown:

SIGNED_______________________

TITLE______________________

"(5) Weld Testing

Weld testing is performed using nondestructive evaluation methods, such as, radiographic, ultrasonic, or magnetic particle methods, as outlined in pertinent VTM's.

The Contractor shall provide a working space for radiographic examination of welds, and shall permit this area to be free for a minimum of 6 hours per inspection visit.

The Central Office Laboratory should be contacted if there is any question of the quality of groove welds in new construction, or if there is suspicion of fatigue cracks in old structures.

(6) Welder Qualifications

The Contractor shall submit to the inspector, for each Welder, Welding Operator, or Tacker employed on the project, a copy of the certification of qualification and also a certificate stating that the Welder has not exceeded any period of three months since the date of qualification without performing satisfactory welding in the required process. The qualification certification shall state the name of the Welder, Social
Security Number, the name and title of the person who conducted the examination, the kinds of specimens, the positions of welds, the results of the tests, and the date of examination. The qualification certification shall be done by a recognized agency which is staffed and equipped for such purposes. Project Inspectors should record the Welder's name, type, and position of weld qualified, and the card number in the project diary for documentation. The Inspector, upon receipt of the certification documents for field welding, shall perform the following procedures:

1. Contact the District Representative designated as being responsible for review of welding documents.

2. In the event the Welder, has been approved on another project in the District, the District Representative can give immediate approval.

3. If the Welder has not been previously approved in the District, the District Representative is to contact, the Central Office Laboratory Structures Section for approval and then advise the Inspector accordingly.

4. Upon receipt of verbal approval from the District Representative, the Inspector is to advise the Contractor and welding may proceed.

5. The Inspector should then forward the certification along with all other related information to the State Materials Engineer. Written approval for documentation of records will follow through normal channels. The validity of the certification should be established before the welding is performed.

It is suggested that a form similar to the one shown below be given to the Contractors at the preconstruction conference, on which the certificate of qualification can be made. This form can then be completed and submitted to the Inspector at the appropriate time. General outline of the form is as follows:

Date _______________________
Project _____________________
FHWA ______________________
County or City ______________
TO: ____________________________________, Residency Administrator
SUBJECT: Welder Qualifications

Transmitted herewith is a copy of Welder certificate of qualification for ____________________________ (Name of Welder), (Cert. No. _________), who will be performing the welding on the above noted project. I/we certify that the above Welder has not exceeded any period of three months since the date of qualification without performing satisfactory welding in the required process.

Signed: ________________________ Title: ________________________
Company ________________________

Note: Residency Administrator to send copies of this letter and certificate of qualification to the District Representative responsible for review of welding documents.

(7) Special Welding Procedures

All field weld splices of girder and rolled beam are required to conform to the quality standards of the American Welding Society.

(a) All flange splices to be ground flush.
(b) All exterior sides of web splices in exterior members to be ground flush.

(c) Cope holes are not to be filled. Radius of cope to be ground smooth and in a true radius.

(d) Temporary erection bolt holes to be filled with high strength bolts and tightened in accordance with Road and Bridge Specifications.

(8) **Studs**

The first 2 studs welded on each girder or beam shall show 360° flash, and withstand bending 30° from their initial axes by striking the head of the stud with a hammer. If the first 2 studs do not show 360° flash, or fail in the weld during bending, 2 additional studs shall be tested after the welding equipment is adjusted. If these also fail, a separate test piece shall be used until the proper adjustments have been made to the equipment. Once this test has passed, production welding may take place. Any stud that has less than 360° flash shall be bent 15° from its original axis in a direction away from the missing portion of flash and if any failure occurs it shall be replaced.

(9) **Electrodes**

If low hydrogen 7018 electrodes are used in welding, they shall be stored in ovens at a temperature of at least 250°F (120°C). If the electrodes are out of the oven over 4 hours, they are to be dried as AWS Specifications.

**Sec. 204.33 Structural Timber and Lumber**

(Sec. 236) See Sec. 207 for details of acceptance on modified inspection. Sampling of structural timber, timber piling, lumber, posts, etc. will not be necessary in the field. The penetration and retention of the preservative treatment is determined at the point of treatment. Acceptance of timber and lumber shall be as stated in Section 204.29. The lumber shall be visually inspected for grade mark.

The lumber shall also be visually inspected for Type of Preservative and Use Category System. These designations may be found on a label affixed to the wood or the certification document. The Use Category system utilizes letters and numbers to describe the exposure conditions (Ex. UC4A = ground contact)

The four major Use Category System designations encountered in VDOT maintenance and construction work are:

- UC4A: Ground contact, fresh water contact or other conditions favorable to wood deterioration. (Ex: sign posts, fence posts and gates).
- UC4B: Ground contact in severe environments, critically important components and salt water splash zones (Ex: bridge timbers, bridge decking, guardrail posts and offset blocks).
- UC4C: Ground contact in very severe environments, or climates with an extremely high potential for deterioration of critical structural components. (Ex: foundation pilings).
- UC5B: Wood exposed to salt and brackish water (Ex: piles, bracing and bulk-heads).

**The Primary wood preservative used for VDOT maintenance and construction work is CCA.**

Bridge timbers and lumber may be treated with creosote (CR) and pentachlorophenol (PCP).

*Creosote (CR) preservative is not allowed for bridge decks.

**Glue laminated members must certify glue is compatible with treatment

Note: All data from AWPA 2005 Standard

For any product not listed refer to the latest AWPA Standard

VDOT allows oilborne preservatives for special projects. These are Creosote (CR) and Pentachlorophenol (PCP).

Construction of handrails, playground equipment and/or picnic tables that are designed for hand contact will be treated with waterborne preservatives (ACQ-B and CA-B) listed in Section 236.

These waterborne preservatives are highly corrosive to metal fasteners, connectors and aluminum signs. Consequently, metal fasteners and connectors used with these alternative wood treatments shall be either stainless steel or hot dipped galvanized steel.

For any product not listed refer to the latest AWPA Standard

### Use Category System Procedure and Tables

For VDOT use, the major wood products, “Use Categories” and associated treatment retention quantities are provided in the above tables.

The basic steps in using the 2005 AWPA Standard are listed below:

1. Identify the wood product to be treated – these are listed as Commodity Specifications (A-I).
2. Identify the exposure conditions the wood will be subjected to – these are listed as the “Use Categories” (UC4A, UC4B, etc.)
3. Identify the recommended treatment solution (CCA, ACQ-B, CR, etc.)
4. Locate the required treatment retention quantity from the tables in the AWPA Standard.

### Sec. 204.34 Water

(Sec. 216) Water that has been approved for drinking purposes may be used without test in hydraulic cement concrete and cement or lime stabilization, as outlined in Sec. 207. Water from shallow, muddy, brackish, or marshy sources shall not be used.

All other sources shall be approved before using, and a one pint (0.5 liter) sample in a glass or plastic jar shall be submitted to the District or Central Office Laboratory for tests. Samples of water should not be taken from a pond or stream while they are at flood stage.

When necessary to take samples of water for environmental studies, rest areas, including their effluent water, or for other purposes, the Central Office Chemistry Laboratory should be contacted to determine the details of sampling and tests required.

Samples of water shall be packed and marked, in accordance with Sec. 203, using Form TL-11, as outlined in Sec. 800.

Information should be given on the card to show whether the water has been taken from a pond, flowing stream, or other source. Laboratory tests of water will be reported on Form TL-47 and/or TL-33, as outlined in Sec. 800.
Sec. 204.35 Waterproofing and Dampproofing Materials

(Sec. 213) See Sec. 207 for waterproofing materials that may be approved on modified inspection.

(a) Asphalt and Primer
Asphalt and primer shall be sampled the same, as outlined for asphalt material in Sec. 204.05. The size of sample shall be one quart (one liter) of each. One drum lots or less may be accepted on modified inspection, as outlined in Sec. 207.

(b) Fabric
Bituminous saturated cotton fabric and glass fiber shall be sampled by cutting a piece one ft. (0.3 m) long by full width for each shipment. This sample shall be submitted to the Central Office Laboratory in a packaging envelope and marked, in accordance with Sec. 203, using Form TL-10, as outlined in Sec. 800.

(c) Joint Sealers
Horizontal joint sealers shall be sampled the same, as outlined in Paragraph (a) above. The size of sample shall be one quart (one liter). Modified inspection procedure is the same, as outlined in Paragraph (a).

(d) Waterproofing Membranes
Waterproofing membranes, consisting of Systems A, B, C, D, or E of various combinations of primer, mastic, prefabricated laminated membranes of various types, and/or elastomeric expansion films, shall be approved on Manufacturers' certifications. These will require no sampling or testing, and may be accepted on modified inspection, as outlined in Sec. 207.

(e) Reports
Laboratory tests of all waterproofing and dampproofing materials will be reported on Form TL-43, except fabric, which will be reported on Form TL-47. Inspections will be reported on Form TL-109. See Sec. 800 for details.

Sec. 204.36 Wire Rope and Wire Strand
A sample of wire rope shall consist of a piece 10 ft. (3 meters) long and a separate piece 2 ft. (0.6 m) long cut from each spool or coil by means of a hacksaw. Before cutting, the wire rope should be seized on each side of the place where the rope is to be cut. The length of the seizing should be at least the diameter of the wire rope. Any annealed low carbon steel wire of approximately 0.100 in. (2.5 mm) diameter may be used for seizing.

Zinc-coated steel wire strand, for use as span or guy wire for traffic signals or other types of electrical systems, shall be sampled as follows. One sample 6 ft. (2 m) in length, shall be taken from each lot of 5000 ft. (2000 m) or less. For lots of from over 5000 ft. (2000 m) to 30,000 ft. (10,000 m), 2 samples shall be taken; for lots of from over 30,000 ft. (10,000 m) to 150,000 ft. (50,000 m), 3 samples shall be taken; for lots of over 150,000 ft. (50,000 m), 4 samples shall be taken. If a sample fails on first test, 2 additional tests will be made on samples from the same coil or reel. If either of these tests fails, then the lot will be rejected. See Sec. 207 for additional details for acceptance of traffic signal and other electrical components and appurtenances on modified inspection.

All samples shall be wrapped securely and forwarded to the Central Office Laboratory for examination. Form TL-10, filled out in accordance with Sec. 800, should accompany the sample to the Laboratory. Laboratory tests of wire rope and strand will be reported on Form TL-25, as outlined in Sec. 800.
SECTION 205 SUMMARY OF MINIMUM ACCEPTANCE SAMPLING REQUIREMENTS

Tabulated herein is a schedule of the minimum requirements for acceptance sampling and testing of materials by project or plant personnel and the District or Central Office Laboratory. Although project personnel may not be required to test a material, their aid may be enlisted to obtain representative samples for the District or Central Office Laboratory, provided that they are qualified to take samples of the particular material. Sampling shall be conducted, as outlined in Sec. 204.

Where the location for sampling is shown to be the source, and the material arrives at the job site prior to being sampled, then the same rate of sampling is required at the job site as at the source, and only qualified personnel will be permitted to take this sample.

Where modified inspection is called for, the instructions in Secs. 109.03, 110, and 207 will govern, and the Project Inspector must examine the material for cleanliness, uniformity, and freedom from cracks, flaws, and apparent defects.

Rates given herein are the minimums considered desirable to provide effective control of materials under ideal conditions. When conditions are otherwise, the number of samples and tests should be established as deemed necessary to attain the uniformity and level of workmanship intended by the specifications.

The initial testing should be established at a substantially greater frequency than minimum by the Engineer, until he is satisfied that the type of material and the Contractor's equipment and procedures can consistently produce a finished product well within the specification. At this point, the testing frequency may be progressively reduced, if the test results continue to show uniformly good material and workmanship, until minimum frequency is reached. If a failing sample or test is noted, the testing frequency should be increased, as the process is adjusted, until found to be satisfactory. The frequency of sampling and testing should be flexible enough to assure acceptable construction, reflecting changes in the performance of the Contractor's operations.

Contact the District Materials Engineer for instructions in sampling any new or miscellaneous materials not listed herein.

SECTION 206 SUMMARY OF MINIMUM INDEPENDENT ASSURANCE
SAMPLING REQUIREMENTS

Sec. 206.01 Definitions
Quality Control (QC) – also called “process control”. Those actions and considerations necessary to
assess production and construction processes so as to control the level of quality of the end product. This
concept of quality control includes sampling and testing to monitor the process in addition to acceptance
sampling and testing. Quality control testing and monitoring may be done on various processes from the
beginning until the final step where the acceptance sample is the last stage of quality control. It should be
a formalized process by the contractor or producer to ensure compliance with specifications when
acceptance testing is performed. Quality control demands that the process be displayed and updated on a
continuing basis. The Contractor/Producer must have a means to demonstrate this quality control such as
Control Charts.

Acceptance (AT) – Sampling, testing, and the assessment of test results to determine whether or not the
quality of produced material or construction is acceptable in terms of the specifications. Acceptance tests
are compared to the specifications for compliance with material or construction specification limits. They
may be the average of several tests as is the case in testing performed on a lot/sublot basis, rather than
individual sample results. The acceptance tests may be one of the quality control tests, but should be
considered differently.

Independent Assurance (IA) – A management tool that requires an independent party, not directly
responsible for quality control or acceptance testing, to provide an independent assessment of the product
and/or the reliability of test results obtained from the acceptance testing. (The results of independent
assurance tests are not to be used as a basis of product acceptance.) Independent assurance samples are
used to evaluate the accuracy of acceptance sampling and testing, operations and equipment. Independent
assurance sampling and testing is generally performed on split samples to eliminate variability of results
that would be expected from testing different samples. The results are to be compared with the results
from the acceptance test performed on the split sample to ensure those test results are reasonable. The IA
results are not compared to the specification limits.

Quality Assurance (QA) – The process of determining the accuracy of sampling and testing results by
examining the data and/or providing objective evidence to verify the contractor’s quality control sampling
and testing which is used in the agency’s acceptance decision. The Materials Section always performs
quality assurance assessment, sampling and testing. Quality assurance assessment of asphalt and dense
graded aggregate plant produced materials is not performed by taking separate samples, but is an
interpretation of the data from the IA samples and tests. This interpretation is performed within the
asphalt and dense graded aggregate database programs.

Sec. 206.02 Project Site Testing
(a) Acceptance Testing by construction inspectors include slump, air and cylinders for concrete, and
density for asphalt, soil, and aggregates. See Section 314.01, 400 and 503.02 for frequency of testing. If
the testing is done by the contractor, QA testing will be performed by the District Materials Section at the
rate specified in the charts that follow.
(b) Independent Assurance for materials sampled and tested in the field (i.e. densities, concrete) shall be performed by the District Materials Section. The sampling and testing should be performed at the same time and location as the acceptance tests performed by the project inspector at the rates specified in the charts that follow. The results of the tests should be immediately compared to the acceptance test. If the comparison shows the test results to be very similar, then the acceptance test may be used. If there is a significant difference in the test results then an explanation of the actions taken to resolve the difference should be noted. For thin lift density, IA will be performed by the project inspection or Materials personnel in accordance with 504.01(h).

**Sec. 206.03 Plant Site Testing**

(a) Acceptance Testing is performed by the producer for gradation and cement/asphalt content on central mixed aggregate and asphalt mixtures. See Section 311.05 and 502.04 for frequency.

(b) Quality Assurance testing of plant-produced materials is not performed on separate samples, but is an interpretation of the data from the IA tests. This interpretation is performed within the asphalt and aggregate database programs.

(c) Materials accepted on the basis of the producers QC program, such as central mixed aggregates and asphalt mixtures will be evaluated on an annual plant specific IA program annually rather than on a project specific program. The IA test results will be compared to the producers test results by the computerized database in accordance with Chapter III and V and flag any deviations. These deviations will need to be investigated, and a report written to show the actions taken.

**ABBREVIATIONS**

AT – Acceptance
IA – Independent Assurance
C – Performed by Contractor
I – Performed by Inspector
M- Performed by Materials

It is desirable to use a nuclear gauge for the I.A. test other than that assigned to the project. It is permissible to use the same gauge as assigned to the project.) If acceptance density tests on Special Projects listed in Chapter 7 have been waived by District Materials Engineer, no I.A. density tests are required, provided this is documented in project records.</td>
</tr>
</tbody>
</table>
1.(a)(3) Density, Other Methods...

One test per 4 roadway miles (6 roadway kilometers), or fraction thereof, if nuclear method not used. Minimum of one per project, unless total quantity of individual material (base, subbase, etc.) is less than 500 tons (500 metric tons) per project, in which case no I.A. test required for that material. See Remarks.

From roadway. Results of I.A. density tests to be recorded on Form TL-136. (Although optional, it is suggested that the density test method used for both I.A. and acceptance tests be the same, either nuclear or other approved method, as the case may be. When using test methods other than nuclear, I.A. personnel should use test equipment other than that assigned to the project.) If acceptance density tests on Special Projects listed in Chapter 7 have been waived by District Materials Engineer, no I.A. density tests are required, provided this is documented in project records.

1.(b) Shoulder Material (Untreated)

One test per 4 roadway miles (6 roadway kilometers), or fraction thereof, alternating sides. Minimum of one per project, unless total quantity of shoulder material is less than 500 tons (500 metric tons) per project, in which case no I.A. test required.

From roadway, alternating sides. Results of I.A. depth tests to be recorded on Form TL-136. If acceptance depth tests are randomly selected as I.A. depth tests, these will also be recorded on Form TL-105. I.A depth tests should be performed at the same station as the acceptance test.
1.(b)(2) Density, Nuclear

One test per 4 roadway miles (6 roadway kilometers), or fraction thereof, alternating sides, consisting of the average of 5 readings. Minimum of 5 readings per project, unless total quantity of shoulder material is less than 500 tons (500 metric tons) per project, in which case no I.A. test required. See Remarks.

From roadway, alternating sides.

Location of 5 density readings at a station selected for acceptance test. See Note 4 for density method and Note 5 reports. (Although optional, it is suggested that the density test method used for both I.A. and acceptance test be the same, either nuclear or other approved method, as the case may be. It is desirable to use a nuclear gauge for the I.A. test other than that assigned to the project. It is permissible to use the same gauge as assigned to the project.) If acceptance density tests on Special Projects listed in Chapter 7 have been waived by District Materials Engineer, no I.A. density tests are required, provided this is documented in project records.

1.(b)(3) Density, Other Methods..

One test per 4 roadway miles (6 roadway kilometers), or fraction thereof, alternating sides, if nuclear method not used. Minimum of one per project, unless total quantity of shoulder material is less than 500 tons (500 metric tons) per project, in which case no I.A. test required. See Remarks.

From roadway, alternating sides.

Results of I.A. density tests to be recorded on Form TL-136. (Although optional, it is suggested that the density test method used for both I.A. and acceptance tests be the same, either nuclear or other approved method, as the case may be. When using test methods other than nuclear, I.A. personnel should use test equipment other than that assigned to the project.) If acceptance density tests on Special Projects listed in Chapter 7 have been waived by District Materials Engineer, no I.A. density tests are required, provided this is documented in project records.

3.(a) Asphalt Concrete Base, Binder, & Surface Material -
3.(a)(1) Depth...
See Section 500 for requirements.

3.(a)(2) Density, Nuclear....

6. Soil-Cement or Soil-Lime -
(a) Stabilized Subgrade (Mat'l-in-Place or Imported Mat'l, Other Than Aggregate Base, Subbase, or Select Material)

   (1) Depth....

   One test per 4 roadway miles (6 roadway kilometers), or fraction thereof. Minimum of one per project, unless stabilization work is less than one mile (2 kilometer), in which case no I.A. test required.

   From roadway.

   Results of I.A. depth tests to be recorded on Form TL-136. If acceptance depth tests are randomly selected as I.A. depth tests, these will also be recorded on Form TL-105. Tests should be from the same station as acceptance test.

   See Note 3 for nuclear test method and Note 5 for reports. (Although optional, it is suggested that the density test method used for both I.A. and acceptance tests be the same, either nuclear or other approved method, as the case may be I.A. personnel should use test equipment other than that assigned to the project.) Location of tests should be at the same station as acceptance tests.

From roadway.
6.(b) Treated Aggregate Base, Subbase, & Select Materials (Regardless of Where Used in Pavement Structure)

6.(b)(1) Depth. One test per 4 roadway miles (6 roadway kilometers), or fraction thereof. Minimum of one per project, unless quantity of treated material is less than 500 tons (500 metric tons) per project, in which case no I.A. test required.

6.(b)(2) Density, Nuclear.... One test per 4 roadway miles (6 roadway kilometers), or fraction thereof, consisting of the average of 5 readings. Minimum of 5 readings per project, unless quantity of treated material is less than 500 tons (500 metric tons) per project, in which case no I.A. test required.

From roadway. Results of I.A. depth tests to be recorded on Form TL-136. If acceptance depth tests are randomly selected as I.A. depth tests, these will also be recorded on Form TL-105. Depth tests are to be taken at a station selected for acceptance testing.

From roadway. Location of 5 density readings at a station selected for acceptance testing. See Note 4 for density method and Note 5 for reports. (Although optional, it is suggested that the density test method used for both I.A. and acceptance tests be the same, either nuclear or other approved method, as the case may be. It is desirable to use a nuclear gauge for the I.A. test other than that assigned to the project. It is permissible to use the same gauge as assigned to the project.)
6.(b)(3) Density, Other Methods.

One test per 4 roadway miles (6 roadway kilometers), or fraction thereof, if nuclear method not used. Minimum of one per project, unless quantity of treated material is less than 500 tons (500 metric tons) per project, in which case no I.A. test required.

From roadway.

Results of I.A. density tests to be recorded on Form TL-136. (Although optional, it is suggested that the density test method used for both I.A. and acceptance tests be the same, either nuclear or other approved method, as the case may be. When using test methods other than nuclear, I.A. personnel should use test equipment other than that assigned to the project.)
Note 1. The above listed samples shall be obtained, packed, marked, and submitted to the proper Laboratory for testing, as outlined in the sections covering each individual material in Secs. 200, 300, 400, and 500, unless otherwise noted in Secs. 202.04 or 206.

Note 2. Nuclear density tests of embankments and soil-cement or soil-lime stabilized subgrade will be conducted using the Direct Transmission Method of testing.

Note 3. Nuclear density tests of cement or lime treated aggregate base, subbase, and select materials, untreated aggregate base, subbase, select, and shoulder materials, and asphalt concrete materials will be conducted using the Backscatter, Control Strip Method of testing.

Note 4. Independent assurance nuclear density test reports will be made on Forms TL-53, TL-54, TL-55, and TL-124, depending on type of material. Likewise, other tests and materials will be reported on the same forms as used for routine acceptance testing. All forms used to report I.A. testing will be marked "I.A. Test". In addition to the detailed test reports, all I.A. depth and density tests shall be tabulated on Form TL-136. See Sec. 202.04 for proper distribution of I.A. reports.
SECTION 207 SUMMARY OF MATERIALS SUBJECT TO MODIFIED INSPECTION AND ACCEPTANCE PROCEDURES

Listed herein are the materials that may be accepted on the basis of modified inspection procedures, when meeting the criteria outlined in Sec. 109.03, together with the specific acceptance criteria outlined below, and providing that the material has no apparent defects. The materials subject to modified acceptance are separated into types of construction, such as, general, rest area, and signalization or other electrical system installation. The lists are not all inclusive, but they do provide a basic guideline, that should be useful in determining the requirements for acceptance of many of the various miscellaneous materials. See also Chapter 7 for additional details of and requirements for acceptance of materials on Special Projects.

It should be noted that, in some cases herein, materials are listed that require either full testing or partial testing coupled with some form of certification for acceptance. This is particularly true for rest area and electrical materials, and the materials are shown this way in an effort to further distinguish between similar miscellaneous materials that may be accepted by modified procedures and those that require testing. If a material is to be used that is not listed herein or elsewhere in Sec. 200 of the Manual, the District Materials Engineer should be contacted promptly for instructions for proper acceptance of the material.

Where materials notebooks are required, a record of all material accepted on modified inspection must be entered in the book, giving complete information as to the type of material, accurate quantity, source, and condition as determined by visual inspection. See Chapter 7 or details of types of projects not requiring a materials notebook.

Sec. 207.01 Manufacturers’ and Producers’ Certifications

As previously noted, one of the means of modified acceptance of materials is through the use of Manufacturers' and Producers’ certifications, certificates of compliance, mill analyses, shop drawings, catalog cuts (in certain cases), or other similar approved documentation in lieu of test reports.

In the case of materials accepted on Manufacturer's certification, the Central Office Laboratory (usually the General Services or Structures Section) will review and approve the certification upon receipt, or have it reviewed by the appropriate Central Office Division, assign a number (which will appear in the lower right portion of the cover letter of transmittal), and distribute the necessary copies to the field, the same as routine test reports, except as noted hereafter. See Sec. 106.01 (b) for details of initial handling and routing of certifications.

The certification number should be treated the same as a test report number and recorded in the materials notebook by the Project Inspector. (See Chapter 7 for details of projects not requiring a materials notebook.) Approved and numbered certifications, for materials requiring same, should be received from the Central Office within 3 calendar weeks of delivery of the subject material at destination, either at the project site or from Purchase Order at the Residency. If the certification is not received in the prescribed time, the Project Inspector or Residency Administrator should forward to the District Materials Engineer the certification copy, if any, received with the material shipment. This will, in turn, be forwarded to the Central Office Laboratory for approval, numbering, and distribution. If no copy has been received at the project or Residency, either with the shipment or from the Central Office within 3 calendar weeks of delivery of material, then the Central Office Laboratory must be notified promptly through the District Materials Engineer, in order that proper certifications can be obtained.

Following are details of distribution and routing for some of the most customary types of certifications.
(a) Routine Constructions Projects

In the case of materials accepted by letter of certification or certificate of compliance on routine
construction projects, the Supplier normally will send one copy of the certification with the shipment of
material to the project and the original and 2 copies to the District Materials or Residency Administrator,
as directed. After initial review, these shall be forwarded to the State Materials Engineer, who will
process and distribute to the field as noted above. Distribution will be the same as for test reports.

(b) Rest Area Projects

In the case of rest area projects, certifications for materials requiring same will be routed to the State
Materials Engineer, who will process and distribute to the field as noted above. If the certifications are
received first by the Environmental Quality Division, usually from the Architect, Consultant, or
Contractor, then that Division will forward the certifications to the State Materials Engineer, after first
reviewing the documents for specification compliance with physical, dimensional, mechanical, or other
pertinent requirements. This includes catalog cuts used in lieu of Manufacturers' certifications. Field
distribution of the certifications will include copies for both the District Materials Engineer and the
District Environmental Coordinator or Environmental Specialist.

(c) Signalization and Electrical System Installation Projects (Administered by Traffic Engineering
Division)

In the case of signalization and electrical system installation projects administered by the Traffic
Engineering Division, acceptance of electrical materials and equipment used therein will be in accordance
with the Pre-Approved Traffic Control Device Listing published by that Division. Where indicated on the
list, certain materials will require testing. See Also Sec. 207.04.

(d) Signalization and Electrical System Installation (Administered by Equipment Division)

In the case of materials obtained on special order by the Equipment Division for signalization and
electrical system work, certifications for these materials where required normally will be obtained by the
Equipment Division and forwarded to the State Materials Engineer after receipt and review for
specification compliance. This includes catalog cuts used in lieu of Manufacturers' certifications.

After processing, the Central Office Laboratory will keep the certifications on file with other related job
records as required. The Equipment Division will be advised by the Central Office Laboratory General
Services Section of the approval and disposition of the documents.

(e) Purchase Order Material

In the case of materials obtained on Purchase Order for stocking either at the Central Warehouse or at
Residencies, the Central Office Laboratory will be sent copies of the Purchase Orders by the
Administrative Services Division. From these, the Materials Division will obtain certifications for
materials requiring same, will process the certifications, and will distribute to the field as necessary.
Copies will be sent to the District Materials Engineer and Residency Administrator, if material is for
Residency stock. The original of the certification will be retained in the Central Office Laboratory,
General Services Section in the file with the respective Purchase Order.

(f) Substitution of Catalog Cuts

In certain cases and for certain materials, catalog cuts may be used in lieu of Manufacturers' certifications,
provided that specific criteria are met. See list of materials herein to which this procedure specifically
applies. The criteria are as follows:

1. The material in question must be listed specifically herein as subject to this type acceptance and
   not specifically requiring testing.

2. The catalog cut must contain a "reviewed" stamp, signed by a representative of the
   Environmental Quality Division or Equipment Division who is handling the administration of the job.
(3) The catalog cut must contain the project number or Purchase Order number.

(4) If the catalog cut contains a number of items, the designated item for use must be distinguished in some way, such as underlining, check mark, or other means.

(5) If the job specifications require that the material meet a certain specification, then either the catalog cut must contain this statement or a separate statement to this effect must be furnished by the Contractor or Supplier.

Where catalog cuts are used in lieu of Manufacturer's certification, these should likewise be forwarded to the State Materials Engineer for review and approval, as outlined above.

**Sec. 207.02 Materials for General or Routine Construction**

Listed below are various materials for use in general or routine construction and the criteria by which the materials may be accepted on modified inspection basis. The list includes those materials or types of construction used on Special Projects, as outlined in Chapter 7, except rest area and traffic signalization and electrical system installation projects. These are covered separately below.

The materials listed below may be accepted on modified inspection procedures in the amounts and under the conditions specified. Larger amounts of material than those specified must be tested, and, where test reports have been received to cover any of these materials, they should be recorded in the proper place in the materials notebook.

(1) Admixtures, concrete. (By approved annual list from the Materials Division. See Chapter 7.)

(2) Aggregates -

   (a) Open graded, for hydraulic cement concrete, when used in sign islands, sign footings, culvert joint mortar, or other small incidental items. (50 Tons (50 metric tons) or less per size per project requires no testing.)

(3) Aluminum alloys, sheet, plate, etc. (Approved on Manufacturer's certified physical and chemical analyses.) (Sign blanks accepted on visual inspection, with occasional sample to be checked for dimensional requirements of specifications (thickness, etc.). For other specified aluminum items, see Fencing, Pipe, and Poles and Posts herein.)

(4) Antistripping additives. (By approved annual list from the Materials Division. See Chapter 7.)

(5) Asphalt release agents. (By approved annual list from the Materials Division. See Chapter 7.)

(6) Asphalt impregnated woven fabric. (100 yd² (100 m²) or less requires no testing or certification.)

(7) Bearing pads and bedding materials.

   (a) Bearing pads used for transverse lateral tensioning of prestressed concrete bridge beams. (Require no testing or certification.)

   (b) Sheet lead and common desilverized lead bedding material. (Same as Item 7(a) above.)

(8) Asphalt Concrete. (Not conforming to Sec. 211 of Road and Bridge Specifications.)

   (a) H-Order materials for winter patching use only. (When the material is obtained at a rate of 50 tons (50 metric tons) or less per day, the Area Construction Engineer may, at his discretion, accept material being produced for private or other use. Waiver of specification applies only to requirements such as, job-mix approval, certification of compliance with specifications, providing Certified Technician, testing, etc.; but waiver does not apply to specification requirements of plant facility itself.)
(b) H-Order material for emergency repair to restore traffic. (Material produced for non-highway use may be purchased for this purpose, provided the action has the specific approval of the Administrative Services Officer or the Maintenance Engineer prior to the purchase, and that the action and verbal approval are confirmed in writing by the Area Construction Engineer as soon after the event as practicable. Provisions and prohibitions of the waiver are the same as Item 8(a) above.)

(9) Brick. (1000 or less require no testing.)

(10) Bronze and copper alloy. (Approved on Manufacturer's certified physical and chemical analyses.)

(11) Building paper. (Requires no testing or certification.)

(12) Cement, hydraulic. (Approved on Manufacturer's certifications, with periodic bin analyses being supplied to Central Office Laboratory. In addition, District Materials Laboratory will take one check sample per project per 5000 yd\(^3\) (5000 m\(^3\)) of concrete, or one per project for projects in excess of one mile (2 km) of cement stabilization.) (See also Sec. 204.09 herein.)

(a) For hydraulic cement concrete projects containing less than 500 yd\(^3\) (500 m\(^3\)) of concrete. (Approved on Manufacturer's certification and requires no check sampling.)

(b) For cement stabilization work containing less than one mile (2 kilometers) of stabilization. (Same as Item 12(a) above.)

(c) For hydraulic cement concrete, when used in sign islands, sign footings, culvert joint mortar, or other incidental items. (Requires no certification or check sampling.)

(13) Compaction tests for embankments, and aggregate bases and subbases on Special Projects listed in Chapter 7. (Compaction tests are encouraged on a random basis, unless specifically waived by the District Materials Engineer.)

(14) Concrete, miscellaneous hydraulic cement, including all concrete, except base, pavement, prestressed, and structural (bridges, box culverts, and retaining walls), in projects containing less than 50 cu.yd. (38 m\(^3\)) (District Materials Engineer may waive requirement for casting compressive strength cylinders.) (See also Sec. 400 herein.)

(15) Copper sheet and strip for metal waterstops. (Requires no testing or certification.)

(16) Curing materials and protective coatings for hydraulic cement concrete.

(a) Monomolecular film. (Requires no testing or certification.)

(b) Spray-on surface finish. (By approved list.)

(17) Electrical fittings and components. (See also Sec. 204.14(g). For those used in rest area and traffic signalization and electrical system installation projects, see Secs. 207.03 and 207.04 herein. In order for modified acceptance to apply, it is essential that Source of Materials letter indicate the type conduit (PVC, metal, etc.) intended for use.)

(a) Acrylonitrile-butadiene-styrene (ABS) fittings. (Require no testing or certification.)

(b) Aluminum conduit and fittings. (May be accepted, when permitted for use, on certification that it meets requirements of ANSI C80.5.)

(c) Asbestos-cement conduit and fittings. (Conduit approved on Manufacturer's certification. Fittings do not require testing or certification.)

(d) Metal fittings. (Approved on Manufacturer's certified analysis, including zinc content. If galvanized steel conduit and fittings are to receive mastic coating, acceptance may be based on certification that material is galvanized and will be coated with Department approved mastic. If it is
not to be mastic coated, galvanized coating must be tested at location and in manner designated on Source of Materials letter.)

(e) Plastic and PVC conduit and fittings. (Accepted by certification from a Manufacturer or Supplier stating that only PVC, Schedule 40, UL approved conduit will be used. Verification that the schedule 40 is being used may be made through the District Materials Office. Fittings (couplings, tees, elbows, ells, etc.) may be accepted in the same manner. It is not absolutely necessary that the same brand of material be used in the same installation, as long as the parts “mate” and meet the above criteria.)

(f) Boxes, except junction boxes. (Same as Item 17(a) above.)

(g) Pole line hardware. (May be accepted on brand name. The following 3 Manufacturers' products are acceptable. Any others must be submitted to the Materials Division prior to use:

Joslyn Co.           Franklin Park, Il.
A. B. Chance Co.     Centralia, Mo.

Among other items, pole line hardware includes bolts, bands, thimbleye and ovaleye bolts, brackets, clamps, clevises, hangers, nuts, pins, anchor rods, staples, thimbles, and washers.)

(18) Epoxy resins. (15 Gallons (60 L) or less for any one project approved on Manufacturer's certification. Powdered epoxy resins for coating of reinforcing steel accepted by approved list from Materials Division. (See Chapter 7.)

(19) Fencing.

(a) Rods, fittings, and gates for chain-link fencing, including electrical ground rods, wire, and clamps. (Require no testing or certification.)

(b) Rods, fittings, and gates for standard fencing, including electrical ground rods, wire, and clamps. (Same as Item 19(a) above.)

(c) Standard fencing, lawn. (Same as Item 19(a) above.)

(d) Standard fencing, farm fence to replace old, or damaged fence to be reset only. (Same as Item 19(a) above.)

(20) Fiber, hollow forming tubes or shapes for prestressed concrete box slab beams, or hollow piles. (Require no testing or certification.)

(21) Geotextiles. (Up to 3 rolls of material may be accepted on contractor’s certification that materials were tested for a previous project.)

(22) Guardrail, steel beam. (Shipments accepted at job site on visual inspection. Suppliers or Erectors shall file with State Materials Engineer annual certificates of compliance and guarantee. Check samples obtained each 6 months in each District. See also Chapter 7.)

(23) Hardware staples, washers, and miscellaneous. (Require no testing or certification.)

(24) Joint material.

(a) Elastomeric expansion dam. (Approved on Manufacturer’s certification, together with certified materials test results from qualified independent laboratory. For details of acceptance of steel anchor bolts, nuts, washers, and stud anchors for expansion dam, see Item 36 (g) below.)

(b) Silicone. (Accepted on basis of list distributed by Materials Division.)

(c) Waterstops, sheet copper metal. (Require no testing or certification.)
(25) Jute mesh and soil retention mats. (Require no testing or certification.)

(26) Landscape materials.

(a) Fertilizer. (Accepted on receipt of certification by furnishing Form of Affidavit.) If the contract quantity is four (4) tons (4 metric tons) or less, the specified or equivalent fertilizer may be accepted on visual inspection, with no certification required.

(b) Herbicides. (Visually inspected to determine that Manufacturer's container is labeled as required, with composition, brand, and name and address of Manufacturer. Questionable sources will be checked to determine that material is registered with the Department of Agriculture and Consumer Services.)

(c) Mulch. (Fiber mulch approval is based on annual source/inventory sampling program and inclusion on approved list. See Chapter 7.)

(d) Seed. (Same as Item 26(a) above.) When the contract quantities for regular seeding, plus legume seeding, is 500 lbs. (255 kg) or less and the seed is acquired from a Virginia Dealer, the seed may be accepted on visual inspection and no certification will be required.

(27) Lime.

(a) Agricultural. (Approved from periodic Department of Agriculture and Consumer Services list provided by the Environmental Quality Division, showing laboratory test results of lime sources. District Materials Engineer must compare list with proposed job source for each project to check calcium carbonate equivalent and, in addition, must take one sample per project for grading test. See Chapter 7.) When the total contract quantity for agricultural lime or pulverized limestone is 10 tons (10 metric tons) or less and the supplier is on the approved list, the material may be accepted on visual inspection with no sampling or certification requirements.

(b) Hydrated. (Approved on Manufacturer's certification except from new sources.)

(c) Hydraulic. (Same as Item 27(b) above.)

(28) Masonry. (Up to 50 Concrete Masonry Units may be accepted on visual inspection.)

(29) Paint. (20 Gallons (75 L) or less per project requires no testing. Paint, Systems B and F, accepted on approved list and certification. See Chapter 7.)

(30) Piling.

(a) Steel H-beam, sheet, and shell. (Approved on Manufacturer's mill analysis, and requires no sampling or mill inspection.)

(b) Timber. (Requires no testing or certification, but will require visual inspection. Preservative and treatment for treated piles approved at point of treatment.)

(31) Pipe. (When the quantity of any approved type of culvert pipe is 50 ft. (15 m) or less per project, requires no testing or certification.) Otherwise, modified acceptance is handled as follows:

(b) Cast iron. (Visual inspection)

(c) Cattle guard and copper water pipe. (Requires no testing or certification.)

(f) Gaskets and coatings. (By approved list of brand names. See Chapter 7.)

(g) Municipal sewer and water pipe. (Approved on Manufacturer's certification. See Sec. 204.26(n) for list.)

(h) Poly(vinyl chloride) (PVC) plastic pipe fittings. (Same as Item 31(c) above.)
(i) Seamless steel, black and galvanized fittings. (Approved on Manufacturers’ certified analyses, including zinc coating.)

(j) Smooth wall steel pipe used for jacking. (Approved on Manufacturer's certified physical and chemical analyses.)

(k) Stakes and hardware for bituminized-fiber slope and shoulder drains. (Visual Inspection.)

(m) Waterline or handrail pipe. (15 Lengths or less.)

(n) Weephole pipe for abutments and retaining walls. (Same as Item 31(c) above.)

(32) Poles and posts. (For those items used in rest area and traffic signalization and electrical system installation projects, see Secs. 207.03 and 207.04 herein.)

(a) Aluminum alloy pipe for chain-link or standard end, corner, and gate fence posts and braces. (Approved on Manufacturers' certified physical and chemical analyses.)

(b) Aluminum alloy H-column and round aluminum alloy pipe for chain-link line fence posts and braces. (Same as Item 32(a) above.)

(c) Aluminum alloy traffic sign poles, lighting standards, etc., including breakaway support couplings. (Same as Item 32(a) above.)

(d) Locust posts for fencing. (Requires no testing or certification.)

(e) Steel guardrail posts. (Shipments accepted at job site on visual inspection. Suppliers or Erectors shall file with State Materials Engineer annual certificates of compliance and guarantee. Check samples obtained each 6 months in each District.)

(f) Steel posts for snow fence and miscellaneous small signs. (Same as Item 32(d) above.)

(g) Structural steel, rolled rail steel, and galvanized steel traffic sign poles and posts, lighting standards, etc. (See Item 36(g) below for details of acceptance.)

(h) Treated wood fence and guardrail posts. Up to 10 Guardrail Post for GR-7 where Grade No. 1 Dense Southern Pine is required and 25 sign/fence posts, where Grade No. 2 Southern Pine is permitted, may be accepted on visual inspection if they meet the requirements of Section 236 and AWPA Use Category System for retention.

(i) Treated wood traffic sign poles and posts. (Same as Item 32(h) above.)

(j) U-Type galvanized rolled rail steel or aluminum alloy locator posts for RM-2 R/W monuments. (Same as Item 32(a) above.)

(33) Reflective materials.

(a) Retro-reflective sheeting, for use in barricades, channelizing devices, and sign blanks. (Approved on Manufacturer’s certification, based upon prior laboratory/field evaluation.

(34) Soil Surveys. (Not required on Special Projects listed in Chapter 7.)

(35) Spring box overflow. (Requires no testing or certification.)

(36) Steel. (For those items used in rest area and traffic signalization and electrical system installation projects, see Secs. 207.03 and 207.04 herein.)

(a) Castings, forgings, and shafting, except gray-iron castings. (Approved on Manufacturers' certified physical and chemical analyses.)

(b) Grid flooring. (Same as Item 36(a) above.)
June 2014

(c) Miscellaneous metals (timber connectors). (Same as Item 36(a) above.)

(d) Reinforcement. (All except bar mat and welded wire fabric). (Approved on Fabricator's certification and mill analysis for each heat, supplemented with monitor sample each month from each size bar per plant.) (Up to 100 sq. ft. (10 m²) of welded wire fabric may be accepted on visual inspection.)

(e) Reinforcement, bar mat. (Approved at point of fabrication and requires no sampling.)

(f) Reinforcement bar supports, stainless steel or galvanized. (Approved on Manufacturer's or Supplier's certification. See additional details in Sec. 204.32(e)(7).)

(g) Structural steel items; such as, anchor bolts, nuts and washers for elastomeric expansion dams (Item 24(a) above), bolts (except bimetallic and stainless steel anchor bolts), anchor base plates for mast poles, anchor bolts for high mast lighting standards, anchor base flange and shaft for high mast lighting standards, box beam median barriers, copper-bearing steels, curb angles, eyebars, manhole steps, galvanized, rolled rail, or structural steel for traffic sign poles and posts and lighting standards, etc. (Item 32(g) above), structural carbon steel, high-strength steels, stud anchors for elastomeric expansion dams (Item 24(a) above), and drilled well casings and screens. (Approved on Manufacturer's mill analyses and shop inspection, together with fabrication inspection report and Fabricator's Certificate of Compliance, as required.)

(h) Structural steel high-strength bolts, nuts, and washers. (Approved on Manufacturer's test report and Fabricator's Certificate of Compliance together with shop inspection report, if any.)

(i) Structural steel corrugated metal bridge deck forms and accessories. (Approved on Manufacturer's Certificate of Compliance and mill analysis. The District Materials Engineer is to random sample this periodically.)

(j) Structural steel drop inlet steel angles, bars, and/or pipe. (Approved on Fabricator's mill analyses and Manufacturer's certifications for galvanizing. Plant Inspector will issue inspection reports. If billet steel bars are used, these will require sampling and testing. Five (5) units or less of drop inlet grates and covers accepted without certification.)

(k) Structural steel filler metals. (Accepted on approved lists of electrodes and wire-flux combinations. See Chapter 7.)

(l) Structural steel stud shear connectors. (Accepted on approved list of Manufacturer's brand names. See Chapter 7.)

(m) Structural steel, miscellaneous, such as sole and gusset plates fabricated from stock material. (Approved on Fabricator's mill analyses and certifications together with fabrication inspection reports.)

(n) Wire strand and assembly or plain structural steel rods or bolts for transverse lateral tensioning of prestressed concrete bridge beams in place. (Requires no testing or certification.)

(o) Steel pile points and timber pile shoes. (Same as Item 36(n) above.)

(p) Steel pins for RM-2 R/W monuments. (Same as Item 36(n) above.)

(37) Structural timber and lumber. Certification required. Penetration and retention approved at point of treatment.

(38) Water, approved for drinking. (Requires no testing or certification.)

(39) Waterline valves and fittings. (Approved on Manufacturer's certifications or brand names specified.)

(40) Waterproofing and dampproofing materials.
(a) Asphalt and primer. (One drum lots or less require no testing or certification.)

(b) Joint sealers. (Same as Item 40(a) above.)

(c) Waterproofing membranes. (Approved on Manufacturers' certifications.)

(41) Temporary Materials. (Contractor furnished items for temporary installations such as slope drains, detours, etc., items such as guardrail and culvert pipe may be used material accepted on visual inspection.)

(42) Temporary Traffic Control Devices such as barricades, channelizing devices, impact attenuators, warning lights, electronic arrows, and truck mounted crash cushions shall be accepted on visual inspection.

Sec. 207.03 Materials for Rest Area Construction

Materials listed below are those commonly used in rest area construction. In some cases, the materials specification commonly used in rest area contracts may also be listed with the material. It should be noted that occasionally other materials specifications may be used; however, the acceptance criteria will be the same as shown herein. Some of the materials listed may be found to be duplicated in other lists appearing in Secs. 207.02 and 207.04. However, if the material is to be used specifically in rest area construction, then the acceptance of the material will be governed by the criteria outlined below.

Where materials acceptance is by sample, shop drawings, or cut sheets (catalog cuts) as indicated below, these are to be submitted to the Environmental Quality Division for approval prior to use of the material. "Sample" in this case refers to color chips, sample panels, or other architectural models for visual examination by the Environmental Quality Division. Manufacturers' certifications covering materials requirements are to be forwarded to the State Materials Engineer, as outlined in Secs. 207.01 and 207.01(b).

Where both catalog cuts and certifications are listed below for materials acceptance, catalog cuts may be used in lieu of certifications, provided that all criteria listed in Sec. 207.01(f) are met, and provided that no testing is required. Where testing is specified, see other Sections of the Manual for the specific sampling and testing requirements of the individual material concerned. In this case, the material may not be accepted solely on modified inspection.

(a) Rest Area Building

Following are the materials usually found in the rest area building proper, together with the acceptance criteria.

(1) Building foundation compaction. (Test.)

(2) Pipe bedding foundation compaction. (Test.)

(3) Concrete footings and slabs. (Test.)

(4) Hydraulic cement, portland, for floors, ASTM C150. (Manufacturer's certification and check test, as outlined in Sec. 204.09 herein.)

(5) Aggregate, fine and coarse, for concrete. (Test.)

(6) Reinforcing steel. (Test.)

(7) Reinforcing wire fabric. (Test.)

(8) Expansion joint filler, AASHTO M213. (Test.)

(9) Building brick, ASTM C62, Grade SW. (Manufacturer's certification and visual inspection.)
(10) Brick (Face, watertable, arch, paving.) (Sample, Manufacturer's certification, and visual inspection.)

(11) Masonry block, ASTM C90, Grade N, Type I. (Test.) (See Sec. 204.22(a.).)

(12) Hydraulic cement, portland, ASTM C150, Type I, and blended hydraulic cement, ASTM C595, for masonry. (Visual inspection only. Cement for use in exterior wall mortar, ASTM C270, Type N, will require color sample for examination by Environmental Quality Division.)

(13) Masonry cement, ASTM C91. (Visual inspection only. Cement for use in exterior wall mortar, ASTM C270, Type N, will require color sample for examination by Environmental Quality Division.)

(14) Hydrated lime, ASTM C207. (Visual inspection only.)

(15) Quicklime, ASTM C5. (Visual inspection only.)

(16) Sand, ASTM C144. (Visual inspection only.)

(17) Masonry reinforcement. (Cut sheets and visual inspection.)

(18) Cast iron, gray, ASTM A47. (Cut sheets and visual inspection.)

(19) Steel, ASTM A36. (Shop drawings and visual inspection.)

(20) Cast steel, ASTM A27. (Cut sheets and visual inspection.)

(21) Metal primer, Fed. T-T-P-615. (Visual inspection only.)

(22) Preservative treatment on exterior woodwork. (Manufacturer's certification.)

(23) Asphalt or coal-tar saturated roofing felt. (Visual inspection only.)

(24) Paint. (Sample and test.)

(25) Slate roofing, Fed. SS-S-451. (Manufacturer's certification and visual inspection.)

(26) Snow guards, #9 B & S gauge copper or aluminum wire. (Visual inspection only.)

(27) Gutters and downspouts, roof and other flashings, 16 oz. (453 g) (0.56 mm thickness) cold-rolled copper. (Cut sheets and Manufacturer's certification.)

(28) Elastomeric sheeting for waterproofing. (Cut sheets and visual inspection.)

(29) Lumber and millwork, all types (Doors, windows, etc.). (Sample, shop drawings, cut sheets, and visual inspection.)

(30) Insulation. (Cut sheets and visual inspection.)

(31) Weather-stripping. (Cut sheets and visual inspection.)

(32) Caulking compound, Fed. TT-S-00230. (Cut sheets and visual inspection.)

(33) Putty, Fed. TT-P-791, Type II for linseed oil. (Visual inspection only.)

(34) Hardware (Nails, screws, etc.) (Visual inspection only.)

(35) Rope yarn caulking. (Visual inspection only.)

(36) Caulking primer. (Visual inspection only.)

(37) Window glass. (Cut sheets and visual inspection.)
(38) Window screens. (Cut sheets and visual inspection.)

(39) Gypsum wall board, ASTM C36. (Cut sheets and visual inspection.)

(40) Joint treatment and corner reinforcement for dry wall, ASTM C475. (Cut sheets and visual inspection.)

(41) Ceramic tile. (Sample, cut sheets, and Manufacturer's certification.)

(42) Marble window stools. (Sample, shop drawings, and visual inspection.)

(43) Hydraulic cement, gray, portland, ASTM C150, Type I, waterproof, for ceramic tile. (Visual inspection only.)

(44) Sand for ceramic tile. (Visual inspection only.)

(45) Metal trim for dry wall construction. (Cut sheets and visual inspection.)

(46) Finishing hardware (Locks, hinges, etc.) (Shop drawings, cut sheets, and visual inspection.)

(47) Toilet room accessories (Soap dishes, towel holders, etc.) (Cut sheets and visual inspection.)

(48) Electric cabinet unit heaters. (Cut sheets and visual inspection.)

(49) Electric water heaters. (Cut sheets and visual inspection.)

(50) Incinerator vent draft inducer fan. (Cut sheets and visual inspection.)

(51) Exhaust fan. (Cut sheets and visual inspection.)

(52) Water closets and urinals. (Cut sheets and visual inspection.)

(53) Lavatories. (Cut sheets and visual inspection.)

(54) Sinks. (Cut sheets and visual inspection.)

(55) Drinking fountains. (Cut sheets and visual inspection.)

(56) Pipe and fittings, hot and cold water. (Cut sheets and visual inspection.)

(57) Sanitary sewer and vent pipes. (Cut sheets and visual inspection.)

(58) Traps and cleanouts. (Cut sheets and visual inspection.)

(59) Floor drains, Fed. WW-P-541, Type 216. (Cut sheets and visual inspection.)

(60) Sleeves and openings. (Visual inspection only.)

(61) Pipe hangers and supports (UL and Factory Mutual Approval). (Cut sheets and visual inspection.)

(62) Water hammer arrestors. (Cut sheets and visual inspection.)

(63) Escutcheons, cast iron. (Cut sheets and visual inspection.)

(64) Valves - gate valves, wall hydrants (Fed. WW-P-541), hose bibbs (Fed. WW-P-541, Type 207), and drain valves. (Cut sheets and visual inspection.)

(65) Sheet metal, diffusers and registers. (Cut sheets and visual inspection.)

(66) Exhaust fan firestats, NEMA-1. (Cut sheets and visual inspection.)

(67) Electric incinerator vent piping, UL Std. 103. (Cut sheets and visual inspection.)
(68) Fiberglass pipe insulation. (Cut sheets and visual inspection.)
(69) Circuit breakers. (Cut sheets and visual inspection.)
(70) Motor starters. (Cut sheets and visual inspection.)
(71) Electric panelboards. (Cut sheets and visual inspection.)
(72) Disconnect switches. (Cut sheets and visual inspection.)
(73) Metal conduit (metalizing or electro-galvanizing coating, or zinc coating). (Test.)
(74) Copper wire, Type THW. (Cut sheets and visual inspection.)
(75) Conductors, Type RHH. (Cut sheets and visual inspection.)
(76) Pull boxes and wiring troughs, hot dip galvanized. (Cut sheets and visual inspection.)
(77) Raceways and fittings, hot dip galvanized, brand names. (Cut sheets and visual inspection.)
(78) Connectors and terminal lugs, brand names. (Cut sheets and visual inspection.)
(79) Electric wall mounted unit heaters, same as Item 48 above. (Cut sheets and visual inspection.)
(80) Contactors. (Cut sheets and visual inspection.)
(81) Thermostats. (Cut sheets and visual inspection.)
(82) Control switches, Fed. W-S-896(50). (Cut sheets and visual inspection.)
(83) Outlet receptacles, Fed. W-C-59(D3 and D7). (Cut sheets and visual inspection.)
(84) Cover plates, stainless steel or galvanized sheet steel, Fed. W-S-896. (Cut sheets and visual inspection.)
(85) Outlet boxes, galvanized sheet steel. (Cut sheets and visual inspection.)
(86) Lighting fixtures. (Cut sheets and visual inspection.)
(87) Hand dryers. (Cut sheets and visual inspection.)
(88) Well pumps. (Cut sheets, Manufacturer's certification, and visual inspection.)
(89) Drop pipe, Schedule 40, galvanized steel pipe. (Visual inspection only.)
(90) Air relief valve. (Cut sheets and visual inspection.)
(91) Booster pumps. (Cut sheets, Manufacturer's certification, and visual inspection.)
(92) Pneumatic tank. (Shop drawings, cut sheets, Manufacturer's certification, and visual inspection.)
(93) Air compressor. (Cut sheets, Manufacturer's certification, and visual inspection.)
(94) Water storage tank. (Shop drawings, cut sheets, Manufacturer's certification, and visual inspection.)
(95) Pump controls, all electrical. (Shop drawings, cut sheets, and visual inspection.)
(96) Well and tank piping, valves, and fittings. (Cut sheets and visual inspection.)
(97) Underground water distribution pipe, valves, valve boxes, and water meters. (Cut sheets, Manufacturer's certification, and visual inspection.)
(98) Fiberglass pipe insulation, same as Item 68 above. (Cut sheets and visual inspection.)

(b) Pump House Buildings
Following are the materials usually found in the construction of pump house buildings, together with the acceptance criteria. Refer to the other Paragraphs herein for other materials that may be used, but not listed below.

(1) Doors and frames, metal, Fed. RR-D-575. (Shop drawings, cut sheets, and visual inspection.)

(2) Frame anchors (Steel, zinc coated, or rust-inhibitive painted.) (Shop drawings, cut sheets, and visual inspection.)

(3) Hardware. (Shop drawings, cut sheets, and visual inspection.)

(4) Paint. (Sample and test.)

(6) Exhaust fan. (Cut sheets and visual inspection.)

(c) Drilled Well
The following materials will usually be used in the drilled well. For any other materials that may be used, but not listed below, refer to the other Paragraphs herein.

(1) Casings, ASTM A120, Standard Weight, New Black Steel. (Manufacturer's certification.)

(d) Water System Electrical Equipment
The following materials will usually be used in the water system electrical controls. For any other materials that may be used, but not listed below, refer to the other Paragraphs herein.

(1) Safety switches. (Cut sheets and visual inspection.)

(2) Power panel. (Shop drawings, cut sheets, and visual inspection.)

(3) Electric unit heater, same as Items (a)(48) and (a)(79) above. (Cut sheets and visual inspection.)

(4) Exhaust fan. (Cut sheets and visual inspection.)

(5) Exhaust fan thermostat. (Cut sheets and visual inspection.)

(6) Control panel. (Shop drawings, cut sheets, and visual inspection.)

(7) Light fixtures. (Cut sheets and visual inspection.)

(e) Gravity Sewers
Following are the materials usually found in the gravity sewer system, together with the acceptance criteria. For any other materials that may be used, but not listed below, refer to the other Paragraphs herein.

(1) Sewer pipe, vitrified clay, ASTM C700. (Test.)

(2) Sewer pipe, concrete sewer, ASTM C14, Table II. (Test.)

(3) Sewer pipe, asbestos-cement, ASTM C428, Class 2400. (Test.)

(4) Ductile iron pipe, ANSI A21.51, thickness Class 2. (Manufacturer's certification.)

(5) Fittings. (Test.)

(6) Rubber gaskets for sewer pipe joints, ASTM C443, for concrete or clay pipe; ANSI A 21.11, for ductile iron pipe. (Test.)
(f) Tool Houses
Following are the materials usually used in the tool house construction, together with the acceptance criteria. For any other materials that may be used, but not listed below, refer to the other Paragraphs herein.

1. Doors and frames, metal, Fed. RR-D-575, same as Item (b)(1) above. (Shop drawings, cut sheets, and visual inspection.)

2. Anchors (steel, zinc coated or rust-inhibitive painted), same as Item (b)(2) above. (Cut sheets and visual inspection.)

3. Hardware, same as Item (b)(3) above. (Cut sheets and visual inspection.)

4. Paint. (Sample and test.)

5. Roofing, same as other buildings. (Manufacturer's certification and visual inspection.)

(g) Water and Sewage System
Following are the materials usually used in the water and sewer system construction, together with the acceptance criteria. For any other materials that may be used, but not listed below, refer to the other Paragraphs herein.

1. Well seal. (Manufacturer's certification.)

2. Package hypochlorinator. (Shop drawings, cut sheets, and visual inspection.)

3. Copper tubing. (Cut sheets and visual inspection.)

4. Yard hydrant. (Cut sheets and visual inspection.)

5. Electric heat tracing. (Cut sheets and visual inspection.)

6. Pipe insulation, metal jacket. (Cut sheets and visual inspection.)

7. Hammer arrester. (Cut sheets and visual inspection.)

8. Comminutor. (Shop drawings and cut sheets.)

9. Aerator. (Shop drawings, cut sheets, and Manufacturer's certification.)

10. Clarifier. (Shop drawings and cut sheets.)

11. Clarifier center well. (Shop drawings and cut sheets.)

12. Air lift sludge pump. (Shop drawings and cut sheets.)

13. Sewage chlorinator. (Shop drawings and cut sheets.)

14. Reaeration system blower. (Shop drawings, cut sheets, and Manufacturer's certification.)

15. Stop gates frames. (Shop drawings and cut sheets.)

16. Wall sleeves. (Visual inspection only.)

17. pH Analyzer system. (Shop drawings and visual inspection.)

18. Wall louvers. (Shop drawings or cut sheets, and visual inspection.)

19. Well enclosure hatch. (Shop drawings and cut sheets.)
(h) Rest Area Grounds

Following are the materials usually equipping the outside rest area grounds, together with the acceptance criteria. For any other materials that may be used, but not listed below, refer to the other Paragraphs herein.

1. Parking lot luminaires. (Cut sheets and Manufacturer's certification.)

2. Security luminaires. (Cut sheets and Manufacturer's certification.)

3. Picnic tables. (Cut sheets and visual inspection.)

4. Grills. (Cut sheets and visual inspection.)

5. Trash cans. (Cut sheets and visual inspection.)

6. Benches. (Cut sheets and visual inspection.)

7. Bulletin boards. (Shop drawings, cut sheets, and visual inspection.)

8. Water fountains. (Cut sheets and visual inspection.)

9. Signs. (Sample, shop drawings, and cut sheets.)

10. Pavers, brick outside. (Sample, cut sheets, and Manufacturer's certification.)

Sec. 207.04 Materials for Signalization and Electrical System Installation

Materials listed below are those commonly used in traffic signalization and other electrical system installation work. In some cases, the materials specification commonly used for the work may also be listed with the material. It should be noted that occasionally other materials specifications may be used; however, the acceptance criteria will be the same as shown herein. Some of the materials listed may be found to be duplicated in other lists appearing in Secs. 207.02 and 207.03. However, if the material is to be used specifically in signalization or other electrical system installation, administered by any Division other than Traffic Engineering Division, then the acceptance of the material will be governed by the criteria outlined below. If the installation involves traffic signalization administered by Traffic Engineering Division, then acceptance criteria will be as noted on the Pre- Approved Traffic Control Device Listing, as outlined in Sec. 207.01(c) herein.

Where materials acceptance is by catalog cut, these are to be forwarded to the Division administering the work, either the Equipment Division or other, as the case may be, for approval prior to use of the material. Manufacturers' certifications, mill analyses, fabrication inspection reports, and Fabricators' certificates of compliance covering materials requirements are to be forwarded to the State Materials Engineer, as outlined in Secs. 207.01 and 207.01(d) above. Where both catalog cuts and certifications are listed below for materials acceptance, catalog cuts may be used in lieu of certifications, provided that all criteria listed in Sec. 207.01(f) are met, and provided that no testing is required. Where testing is specified, see other Sections of the Manual for the specific sampling and testing requirements of the individual material concerned. In this case, the material may not be accepted solely on modified inspection.

Following are some of the materials usually found in signalization and electrical system work, together with the acceptance criteria. (See also Sec. 207.02(17).)

1. Anchor bases, cast steel, for mast arm poles, ASTM A27, Grade 65-35, or other. (Manufacturer's certified physical and chemical analyses.)

2. Anchor base plates, for mast arm poles, ASTM A36, or other. (Manufacturer's mill analyses, shop inspection, and fabrication inspection report.)

3. Anchor bolts, steel, for high mast lighting standards, AASHTO M314 Grade 55-S1, ASTM F1554 Grade 55-S1, or other. (Fabricator’s certificate of compliance.)
(4) Anchor rods, for anchor base poles, AASHTO M314 Grade 36, ASTM F1554 Grade 36, or other. (Manufacturer's mill analyses, shop inspection, and fabrication inspection report.)

(5) Base flange and shaft, steel, for high mast lighting standards. (Manufacturer's mill analyses, shop inspection, and fabrication inspection report.)

(6) Bolts, high strength steel, ASTM A325, or other. (Manufacturer's test report and Fabricator's certificate of compliance.)

(7) Cable clamps. (No testing or certification required.)

(8) Cable hangers. (No testing or certification required.)

(9) Cable rings. (No testing or certification required.)

(10) Clevises. (No testing or certification required.)

(11) Concrete, miscellaneous hydraulic cement. (See Sec. 207.02, Item 14 above, for criteria for acceptance with reduced testing and inspection.) (If installation work is administered by Equipment Division personnel, they will secure the delivery ticket containing the required Producer's statement of batch data.)

(12) Conductors, ASTM B3, B8, or other. (Manufacturer's certification and catalog cut.)

(13) Conduit, metal. (Test. Metal fittings approved on Manufacturer's certified analysis, including zinc content.)

(14) Connectors and terminals. (Manufacturer's certification and catalog cut.)

(15) Controllers. (Manufacturer's certification and catalog cut.)

(16) Controller cabinets. (Manufacturer's certification and catalog cut.)

(17) Detectors. (Manufacturer's certification and catalog cut.)

(18) Epoxy resins. (Test, unless material meets provisions and requirements of Sec. 207.02, Item (18) above, in which case accept as noted.)

(19) Ground clamps, ASTM A220, Any Grade, or other. (Manufacturer's certified physical and chemical analyses.)

(20) Ground rods. (No testing or certification required.)

(21) Ground wire, ASTM B2, or other. (Manufacturer's certification and catalog cut.)

(22) Guy anchors. (No testing or certification required.)

(23) Guy guards. (No testing or certification required.)

(24) Insulators. (Manufacturer's certification and catalog cut.)

(25) Lamps. (Manufacturer's certification and catalog cut.)

(26) Poles, aluminum, including breakaway, for lighting standards, luminaires, pedestal poles, or other, AASHTO Standard Specification for Structural Supports for Highway Signs, Luminaires, and Traffic Signals. (Manufacturer to certify that product meets noted specification. Also, if poles are required to meet certain alloy specifications, such as ASTM, then Manufacturer's certified physical and chemical analysis is required. This includes aluminum alloy breakaway support couplings, ASTM B209 or other.)
(27) Poles, steel, for traffic signals. (Manufacturer's mill analyses, shop inspection, and fabrication inspection report.)

(28) Poles, steel, including breakaway, for lighting standards, high mast lighting standards, mast arm poles, combination mast arm-luminaire arm poles, and pedestal poles, AASHTO Standard Specification for Structural Supports for Highway Signs, Luminaires, and Traffic Signals. (Manufacturer to certify that product meets noted specification. Also, if poles are required to meet certain other specifications, such as ASTM, then requirements of Item 2 above must be met.)

(29) Poles and wood treated for traffic signals (ANSI 05.1). Penetration and retention approved at point of treatment. Certification required.

(30) Relays. (Manufacturer's certification and catalog cut.)

(31) Splice and switch boxes. (Manufacturer's certification and catalog cut.)

(32) Steel, reinforcing. (Test.)

(33) Switches. (Manufacturer's certification and catalog cut.)

(34) Tape. (No testing or certification required.)

(35) Thimbleye bolts. (No testing or certification required.)

(36) Thimble nuts. (No testing or certification required.)

(37) Traffic signal heads. (Manufacturer's certification and catalog cut.)

(38) Washers. (No testing or certification required.)

(39) Wire, span and guy, ASTM A475, or other. (Test.) (See also Sec. 204.36 herein.)

SECTION 208 - DELETED, Reference Manual of Instructions Chapter 7
SECTION 209 - APPROVED LIST POPULATION REQUIREMENTS

Timeframes for population of the lists will depend on several factors including test period required for material, Departments workload, and etc.

Sec. 209.01 Approved List 14 - Pipe Gaskets and Coatings
To have a gasket product included on the Approved List for "Pipe Gaskets and Coatings" the manufacturer shall submit a notarized letter stating the gasket meets the guidelines established in Section 212(h) of the Road and Bridge Specifications.

Sec. 209.02 Approved List 25 - Corrugated Metal Pipe Producers on QA/QC Program
To have a plant included on the Approved List for "Corrugated Metal Pipe Producers on QA/QC Program" the following shall be submitted to Materials Division's Quality Assurance Section: The plant shall submit a location specific QC plan meeting the requirements of Sec. 204.26 (g) & (h). The plant will also be subject to an inspection upon approval of its QC plan.

Upon approval the plant will be placed on the Approved List with probationary status for a minimum of 6 months.

Sec. 209.03 Approved List 26 - Concrete Pipe Producers on QA/QC Program

To have a plant included on the Approved List for "Concrete Pipe Producers on QA/QC Program" the following shall be submitted to the Central Office Materials Division's Quality Assurance Section: The plant shall submit a location specific QC plan meeting the requirements of Sec. 204.26 (f). The plant will also be subject to an inspection upon approval of its QC plan.

Upon approval the plant will be placed on the Approved List with probationary status for a minimum of 6 months.

Sec. 209.04 Approved List 34 - Concrete Precast Producers on QA/QC Program

To have a plant included on the Approved List for "Concrete Precast Producers on QA/QC Program" the following shall be submitted to the Central Office Materials Division's Quality Assurance Section: The plant shall submit a location specific QC plan meeting the requirements of Sec. 204.22 (c). The plant will also be subject to an inspection upon approval of its QC plan.

Upon approval the plant will be placed on the Approved List with probationary status for a minimum of 6 months.
Sec. 209.05 Approved List 42 - High Density Polyethylene (HDPE) Pipe Producers on QA/QC Program

To have a product included on the Approved List for "High Density Polyethylene Pipe Producers on QA/QC program, manufacturer must receive approval from AMRL/NTPEP and make a request to the Central Office Materials Division's Quality Assurance Section for placement on the list.

Sec. 209.06 Approved List 44 - Approved Q/A Suppliers List

To have a product included on the Approved List for "Approved Q/A Suppliers List " the following shall be submitted to the Central Office Materials Division's Quality Assurance Section: The supplier shall submit a location specific QA plan meeting the requirements of Sec. 113.01. The supplier's warehouse will also be subject to an inspection upon approval of its QA plan. Upon approval the plant will be placed on the Approved List with probationary status for a minimum of 6 months.

Sec. 209.07 Approved List 61 - Gray Iron Casting Manufacturers/Distributors on QA/QC Program

To have a product included on the Approved List for "Gray Iron Casting Manufacturers/Distributors on QA/QC Program" the following shall be submitted to the Central Office Materials Division's Quality Assurance Section: The plant shall submit a location specific QC plan meeting the requirements of Sec. 204.32(a). The plant will also be subject to an inspection upon approval of its QC plan. Upon approval the plant will be placed on the Approved List with probationary status for a minimum of 6 months.

Sec. 209.08 Approved List 72 - Detectable Warning Units

To have a product included on the Approved List for "Detectable Warning Units", a notarized letter and sample of product must be submitted to the Materials Division for approval. The letter must certify that the product meets the required specification.
### APPENDICES

**Appendix A : Concrete Pipe Plant Monitor Report**

<table>
<thead>
<tr>
<th>Date</th>
<th>Manufacturer</th>
<th>Producers Technician</th>
<th>Location</th>
<th>District</th>
</tr>
</thead>
</table>

This form is to assist those in the review process. A number of questions are provided for this purpose. The applicable specifications contain greater detail than this check list, which is required to assure that all is in compliance. Use both in this monitoring effort.

#### A. Does the Qualified Technician (QT) have the following equipment?

1. **Calipers**
   - Yes ___  No ___
2. **Steel Tape**
   - Yes ___  No ___
3. **Feeler Gauge 0.01" (0.03 mm)**
   - Yes ___  No ___
4. **Micrometer**
   - Yes ___  No ___
5. **Industry Stamp**
   - Yes ___  No ___

#### Remarks

Do the materials used in the production of concrete pipe meet the applicable specifications? Cement, Aggregates, Reinforcement, Fly Ash, etc.

- Yes ______  No ______

#### Remarks

Has the producer complied with Section 105 for pipe sizes that do not have values listed in the design tables for diameter, wall thickness, compressive strength and reinforcement?

- Yes ______  No ______

#### Remarks

Do shipping tickets/documents contain a statement certifying that the pipe shipped has been tested, inspected and approved under an approved producer QC acceptance program?

- Yes ______  No ______

#### Remarks
B. PHYSICAL REQUIREMENTS

External Load Crushing Strength Test by the Three-Edge Bearing Method

1. Is the testing apparatus in accordance with AASHTO T280?
   Yes _______ No _______
   Remarks ________________________________________________________________

2. Is crack and ultimate load tested properly?
   Yes _______ No _______
   Remarks ________________________________________________________________

3. If any pipe failed, were the appropriate retests performed?
   Yes _______ No _______
   Remarks ________________________________________________________________

4. Is the following information clearly marked on each section of pipe?
   a. The pipe class and specification designation
      Yes _______ No _______
   b. The date of manufacture
      Yes _______ No _______
   c. The name or trademark of the manufacturer and identification of plant
      Yes _______ No _______
   Remarks ________________________________________________________________

5. Are results of all tests recorded by the producer’s technician?
   Yes _______ No _______
   The records should include a minimum of the following:
   Producer’s name __________________________________________________________
   Specifications that pipe is to meet __________________________________________
   Diameter of Pipe _________________________________________________________
   Class and D-load of Pipe __________________________________________________
   Production Dates and Quantity of Pipe per date ______________________________
   Length of Pipe __________________________________________________________
   Wall thickness of Pipe ____________________________________________________
   Total size, quantity of lot __________________________________________________
   Number of tests to be run __________________________________________________
   Results of tests including:
   Date of pipe being tested __________________________________________________
   Gauge reading in pounds (newtons) when .01 (0.03 mm) crack developed ______
   Required minimum gauge reading in pounds for .01 (0.03 mm) crack___________
   Required D-load reading at .01 (0.03 mm) _________________________________
   Gauge reading in pounds (newtons) for ultimate load _________________________
   Required minimum gauge reading in pounds (newtons) for ultimate load _______
Size of wire reinforcing in pipe ________________________________
Required minimum required area of wire reinforcing for pipe _____________
If the initial test or tests fail, retests should be recorded as above but shall be indicated specifically as retest.

C. **ABSORPTION TEST**

1. Is the laboratory adequately equipped to perform the test?
   - Yes _______ No _______
   - Remarks

2. Do test specimens meet the minimum dimensional requirements?
   - Yes _______ No _______
   - Remarks

3. Are absorption tests performed in accordance with the requirements?
   - Yes _______ No _______
   - Remarks

4. Do the absorption test results meet the specified requirements?
   - Yes _______ No _______
   - Remarks

5. If a test specimen failed, was the appropriate retest performed?
   - Yes _______ No _______
   - Remarks

D. **COMPRESSIVE STRENGTH CYLINDERS**

1. Is the laboratory adequately equipped to perform the test?
   - Yes _______ No _______
   - Remarks
2. Are concrete cylinders prepared in accordance with AASHTO T-23 and AASHTO M242?
   Yes ________ No ________
   Remarks _____________________________________________________________

3. Are cylinders cured in like manner as the pipe?
   Yes ________ No ________
   Remarks _____________________________________________________________

4. Are cylinders capped in accordance with AASHTO T-231?
   Yes ________ No ________
   Remarks _____________________________________________________________

5. Are cylinders tested in accordance with AASHTO T-22?
   Yes ________ No ________
   Remarks _____________________________________________________________

6. Are the results of the compression tests equal to or greater than the required strength?
   Yes ________ No ________
   Remarks _____________________________________________________________

7. If a test specimen failed, was the appropriate retest performed?
   Yes ________ No ________
   Remarks _____________________________________________________________

8. Date testing machine was calibrated _____________________________
   Remarks _____________________________________________________________

9. Are results of all tests recorded by the producer’s technician?
   Yes ________ No ________
   Remarks _____________________________________________________________

   The records should include a minimum of the following:
   Producers name _________________________________________________________
   Specification that pipe is to meet _______________________________________________________________________
   Diameter of Pipe _______________________________________________________
   Class of Pipe ___________________________________________________________
   Production Dates and Quantity of Pipe per date ______________________________
   Length of Pipe __________________________________________________________
   Wall thickness of Pipe _____________________________
   Total size, quantity of lot ________________________________________________
   Number of tests to be run ________________________________________________
Results of test including: ____________________________________________

Date of pipe being tested that cylinders represent __________________________

Date concrete cylinders were cast _______________________________________

Compression test machine load __________________________________________

Compressive strength of cylinder in Psi/MPa ______________________________

Minimum required compressive strength of cylinder is PSI/MPa ______________

If initial test or tests fail, retests should be recorded as above, but shall be indicated specifically as retest.

Final Quantity of pipe approved _______________________________________

Production dates of pipe and quantity per date of approved pipe ____________

____________________________________________________________________

Production dates of pipe and quantity per date of not approved pipe ______

____________________________________________________________________

E. COMPRESSIVE STRENGTH - CORES

1. Is the laboratory adequately equipped to perform the test?
   Yes ______ No ______
   Remarks ___________________________________________________________

2. Are cores cut and tested in accordance with AASHTO T-280?
   Yes ______ No ______
   Remarks ___________________________________________________________

3. Are cores capped in accordance with AASHTO T-231?
   Yes ______ No ______
   Remarks ___________________________________________________________

4. Is the compressive strength equal to or greater than the required strength?
   Yes ______ No ______
   Remarks ___________________________________________________________

5. If a test specimen failed, was the appropriate retest performed?
   Yes ______ No ______
   Remarks ___________________________________________________________

6. Date testing machine was calibrated _____________________________
   Remarks __________________________________________________________
7. Are results of all tests recorded by the producer's technician?
   Yes _________ No _________
   Remarks ____________________________________________________________

   The records should include a minimum of the following:
   Producers name ____________________________________________________
   Specification that pipe is to meet ______________________________________
   Diameter of Pipe _____________________________________________________
   Class of Pipe _______________________________________________________
   Production Dates and Quantity of Pipe per date __________________________
   Length of Pipe ______________________________________________________
   Wall thickness of Pipe _________________________________________________
   Total size, quantity of lot _____________________________________________
   Number of tests to be run _____________________________________________
   Results of test including:
      Date of pipe being cored and tested _________________________________
      Size of wire reinforcing in pipe ______________________________________
      Required minimum area of wire reinforcing for pipe _________________
      Diameter of core ___________________________________________________
      Length of Core ____________________________________________________
      Ratio L/D ___________________ Strength Correction Factor _____________
      Area of Core ______________________________________________________
      Compression test machine load _______________________________________
      Compressive strength of core in PSI/MPa ______________________________
      Corrected compressive strength of core in PSI/MPa _________________
      Minimum required compressive strength of core in PSI/MPa ___________

   If the initial test or tests fail, retests should be recorded as above but shall be indicated specifically as retests.
   Final Quantity of pipe approved ______________________________________
   Production dates of pipe and quantity per date of approved pipe____________
   Production dates of pipe and quantity per date of not approved pipe _________
   Remarks ____________________________________________________________

F. MANUFACTURE
1. Does gage of wire, spacing and minimum cover conform to specification?
   Yes _________ No _________
   Remarks ____________________________________________________________

2. Are dimensions, laps and welds of wire cages within tolerance?
   Yes _________ No _________
   Remarks ____________________________________________________________
3. Are curing facilities adequate?
   Yes ________ No ________
   Remarks__________________________________________

4. **Dimensions of Pipe:** Do the following components comply with specification requirements?
   a. Wall thickness?
      Yes _____ No ________
   b. Variation in laying length?
      Yes _____ No ________
   c. Underrun in length?
      Yes _____ No ________
   d. Internal diameter?
      Yes _____ No ________
   e. Bell and spigot?
      Yes _____ No ________

5. Is reinforcing wire/steel exposed?
   Yes ________ No ________
   Remarks__________________________________________

6. Is the position of the reinforcing wire/steel in the pipe within specification?
   Yes ________ No ________
   Remarks__________________________________________

7. Is the spacing center to center of circumferential reinforcement within specification?
   Yes ________ No ________
   Remarks__________________________________________

8. Is the pipe substantially free of fractures, cracks and surface roughness?
   Yes ________ No ________
   Remarks__________________________________________

G. **REPAIRS**

If repairs were necessary, are the repairs sound and properly finished and cured?
   Yes __________ No ________
   Remarks__________________________________________

Coating Repairs: (Zinc/Asphalt): ____________________________________________________________________

Plant Records

Mill Analysis: Yes ____ No ______

Inspection Records: Yes ____ No ______

Are records retained for 2 years? Yes ____ No ______
Appendix C: Reinforcing Steel Fabrication Shop

INSPECTION CHECK LIST

This form shall be used by the VDOT inspector when performing inspection of the reinforcing steel fabricators storage, handling, and fabrication activities. The inspections are to be performed on steel fabricators performing work for Virginia Department of Transportation approximately every 4 - 6 weeks.

Fabricator:__________________________________________________________

Date:__________________________________ Inspector:____________________

1. Check mill analyses for the black reinforcing steel and certifications for the epoxy coating used and the application of the epoxy coating.
   
   Mill Analysis Meet Specifications? _____Yes _____No.

   Comments_________________________________________________________

2. Are padded bundling bars or nylon straps being used during handling of the coated bars? _____Yes _____No.

   Comments_________________________________________________________

3. Are suitable bands being used to prevent damage to the epoxy coating? Bare wire shall not be used.
   _____Yes _____No.

   Comments_________________________________________________________

4. Are bundled bars moved in such a way as to prevent bar-to-bar abrasion due to sagging? Bundle tie wires shall not be used to pick up bundles. _____Yes _____No.

   Comments_________________________________________________________

5. Are drive rolls on shear beds and back-up barrels on benders protected with a suitable cover to minimize damage during fabrication?
   _____Yes _____No.

   Comments_________________________________________________________

6. Are bars stored above the ground on wooden or padded supports? If coated bars are stored outside, are they protected from sunlight?
   _____Yes _____No.

   Comments_________________________________________________________
7. Is bar identification maintained throughout the fabrication process?  
   _____Yes  _____No.  
   Comments________________________________________________________

8. Is the coating being repaired in the shop?  _____Yes  _____No.  
   Comments________________________________________________________

9. How are the bars being cut? (They should not be burned unless fully repaired)  
   Comments________________________________________________________

10. Are epoxy coated bars being repaired within 8 hours after the bars are cut? If not the bars shall be 
    cleaned and repaired according to AASHTO M284.  _____Yes  _____No.  
    Comments________________________________________________________

11. Check certification documents for compatibility of repair material with the epoxy coating. Is the 
    repair material compatible?  _____Yes  _____No.  
    Comments________________________________________________________
Appendix D : **Reinforcing Steel Epoxy Coating Plant Review**

Plant: ______________________________ Date: ______________________________

VDOT Q.A. Inspector (Signature) _____________________________________________

I. BARS

A. Check for contaminants on bars prior to cleaning and coating
   1. Contaminants Observed? 
      _____ Yes _____ No
   2. If Yes, on what number of bars? _______________________________________
      Approximate surface area: ___________________________ Less than 6” (150 mm) in 6 ft. (1.8 m)
      ___________________________More than 6” (150 mm) in 6 ft. (1.8 m)
   3. Corrective Action: ___________________________________________________

B. Check for Surface Defects on Uncoated Bars
   1. Surface Defects Noted? _____ Yes _____ No
   2. Type of Defects: _____________________________________________________
   3. Corrective Action: _________________________________________________

II. BLAST CLEANING

All tests to be performed by plant quality control personnel, and observed by VDOT quality assurance inspector.

A. Comparison to Visual Standards
   1. Bar Size: # _______________________
2. Meets SSPC Vis. 1 degree of cleaning SSPC-SP10?
   a. Sample 1: _____ Yes ___ No Comments _____________________________
   b. Sample 2: _____ Yes ___ No Comments _____________________________
   c. Sample 3: _____ Yes ___ No Comments _____________________________

B. Copper Sulfate Test
   1. Bar Size: ______________________________
   2. Percent of Surface Area Unreacted (i.e., not copper-colored)
      a. Location 1: _____________ % Location 2: _____________ %

C. Chloride Test - Blasted Bar Surface
   1. Bar Size: ______________________________
   2. Chlorides Present (refer to Visual Standard)
      a. Location 1: ______________________________ ppm
         Location 2: ______________________________ ppm
         Location 3 ______________________________ ppm

D. Backside Contamination
   1. Bar Size #: __________________
   2. Percent Contamination
      a. Location 1: ________% Location 2: ________% Location 3: ________%

E. Anchor Profile
   1. Required ____________
   2. Bar Size: # ____________
   3. Location A: Depth _____ mils (µm)
      Location B: Depth _______ mils (µm)
      Location C: Depth _______ mils (µm)
   Average Depth _______ mils(µm)
III. CLEANING ABRASIVE
A. Check Operation of Blasting Equipment
   1. Equipment Functional: _____ Yes ___ No
   2. Comments: _________________________________
B. Check Abrasive Mix for Oil Contamination
   1. Time Mix Sampled: __________________
   2. Oil in Mix: _______ Yes _______ No
   3. If Yes, Action Taken: __________________
C. Chloride Test - Abrasive (Required once per Week)
   1. Chlorides Present: ______________ ppm
D. Sieve Analysis (Required once per Week)
   1. Review Plant Records

IV. HEATING
A. Check Bar Temperature Prior to Coating
   1. Recommended by Epoxy Manufacturer ____________
   2. Bar Size: # __________
   3. Temperature Recorded (1 temperature per bar in the set, i.e., 4-bar line - 4 temperatures should be recorded.)
      °F(°C) °F(°C) °F(°C) °F(°C) °F(°C)

V. POWDER APPLICATION
A. Check for Oxide Formation on Cleaned Bars
B. Check Electro-Static System Operation
   1. System Functional: ____________ Yes _______ No
C. Check Powder Air Supply
   1. Air System Functional: ___________ Yes _________ No

D. Inspect Bar Transport System
   1. Damage to Coating: ___________ Yes _________ No
   2. If Yes, Action Taken: ____________________________________________________________________

E. Check Line Speed
   1. Time from Application Booth to Quench: ____ seconds
   2. Manufacturer’s Recommended Quench Time __ seconds
   3. Bar Size: __

VI. ACCEPTANCE TESTING
   A. Check Operation of In-Line Holiday Detectors
      1. Time: ___________
      2. Detectors Operational: ___________ Yes _________ No
      3. If No, Action Taken: ____________________________________________________________________

B. Check with Hand-Held Holiday Detector
   ___________ No. of Holidays Bar Length: ____________ feet (meters)

C. Calibrate Thickness Gage
   1. Correction for Anchor Profile: ______ mils (µm)

D. Perform Thickness Measurements for One Bar Once Per Shift and Change of Bar Size

Thickness Measurements (Mils) (µm)

|          |          |          |              |          |          |

VII. HANDLING AND STORAGE (PLANT WALKTHROUGH)

A. Inspect Powder Storage
   1. Manufacturer’s Recommendation _________ °F (°C)
   2. OK? ______ Yes ______ No

B. Check Temperature of Powder Storage Area
   1. Temperature: _________ °F (°C)

C. Check Shelf Life of Powder
   1. Manufacturer’s Recommendation ____________________________
   2. Powder Manufacturer’s Lot #’s in Use During Shift: ________

D. Inspect Coated Bars Prior to Shipment
   1. Damaged: _________ Yes _________ No
   2. If Yes, Action Taken: ____________________________
   3. Are damaged areas repaired with compatible material?
      ____ Yes ____ No Brand ____________________________

E. Inspect Stockpiles of Coated Bars (if applicable)
   1. Bars Properly Bundled? _________ Yes _________ No
   2. Bars Properly Stored? _________ Yes _________ No
   3. Rejected Bars Identified and Segregated? _________ Yes ______ No
VIII. General Comments

Appendix E : Precast Concrete Plant Monitor Report

DATE__________________________________________________________

MANUFACTURER________________________________________________________________

PRODUCERS TECHNICIAN________________________________________________________________

LOCATION________________________________________________________________________

DISTRICT __________________________________________________________________________

This form is to assist those in the review process. A number of questions are provided for this purpose. The applicable specifications contain greater detail than this check list, and are required to assure that all is in compliance. Use both in this monitoring effort.

A. Does the Qualified Technician (QT) have the following equipment?
   1. Calipers   Yes ____   No ____
   2. Steel Tape  Yes ____   No ____
   3. Feeler Gauge 0.01” (0.03 mm) Yes ____   No ____
   4. Micrometer  Yes ____   No ____
   5. Industry Stamp  Yes ____   No ____
   6. Pressure Air Meter  Yes ____   No ____

Remarks:__________________________________________________________________________

__________________________________________________________________________________

B. Does the producer maintain a Department approved Quality Control Form for all products produced for VDOT projects.  Yes____ No____

C. PHYSICAL REQUIREMENTS

   1. COMPRESSIVE STRENGTH CYLINDERS

      The results should include a minimum of the following for each lot.

      Results of test including:
      Date of product being tested that cylinders represent__________________________
      Date cylinders were cast____________________________________________________
      Date cylinders were tested__________________________________________________
Compression test machine load ________________________________
Compressive strength of cylinder in PSI/MPa ________________________________
Minimum required compressive strength of cylinder in PSI/MPa ________________________________
If initial test or tests fail, are retests recorded as above, and indicated specifically as retests.
Yes____ No____ Remarks: ________________________________
(1) Is the laboratory adequately equipped to perform the test? Yes____ No____
Remarks______________________________
(2) Are concrete cylinders prepared in accordance with AASHTO T-23? Yes____ No____
Remarks______________________________
(3) Are Cylinders cured in like manner as the product? Yes____ No____
Remarks______________________________
(4) Are Cylinders capped in accordance with AASHTO T231/T22? Yes____ No____
Remarks______________________________
(5) Are Cylinders tested in accordance with AASHTO T22? Yes____ No____
Remarks______________________________
(6) Are the results of the compression tests equal to or greater than the required strength? Yes____ No____
Remarks______________________________
(7) If a test specimen fails, was the appropriate retest performed? Yes____ No____
Remarks______________________________
(8) Date testing machine was calibrated? ________________________________
Remarks______________________________
(9) Are results of the tests recorded by the producers technician? Yes____ No____
2. AIR - CONCRETE

(1) Is the testing of air content observed? Yes____ No____
Remarks__________________________________________________________

(2) Is the testing performed properly? Yes____ No____
Remarks__________________________________________________________

(3) Is an air entraining agent used in dry cast concrete? Yes____ No____
Remarks__________________________________________________________

3. COMPRESSION STRENGTH CORES

The results should include a minimum of the following for each lot.

Results of test including:
- Date of product being tested that cores represent ________________
- Date core was tested ____________________________________________
- Diameter of core _______________________________________________
- Length of core __________________________________________________
- Ratio L/D_________________ Strength Correction Factor ____________
- Area of core ____________________________________________________
- Compression test machine load_______________________________
- Compressive strength of core in PSI/MPa _________________________
- Corrected compressive strength of core in PSI/MPa________________
- Minimum required compressive strength of core in PSI/MPa __________

If initial test or tests fail, are retests recorded as above, and indicated specifically as retests. Yes____ No____
Remarks: _______________________________________________________________________

______________________________________________________________________________

______________________________________________________________________________
(1) Is the laboratory adequately equipped to perform the test? Yes____ No____
Remarks ________________________________________________________________

(2) Are cores cut and tested in accordance with AASHTO T-24? Yes____ No____
Remarks ________________________________________________________________

(3) Are Cores capped in accordance with AASHTO T231? Yes____ No____
Remarks ________________________________________________________________

(4) Are the results of the compression tests equal to or greater than the required strength? Yes____ No____
Remarks ________________________________________________________________

(5) If a test specimen fails, was the appropriate retest performed? Yes____ No____
Remarks ________________________________________________________________

(6) Date testing machine was calibrated? ______________
Remarks ________________________________________________________________

(7) Are results of the tests recorded by the producers technician? Yes____ No____
Remarks ________________________________________________________________

4. ABSORPTION TEST

(1) Is the laboratory adequately equipped to perform the test? Yes____ No____
Remarks ________________________________________________________________

(2) Do test specimens meet the minimum dimensional requirements? Yes____ No____
Remarks ________________________________________________________________
(3) Are absorption tests performed in accordance with the requirements? Yes____ No____
Remarks ____________________________________________________________________________

(4) Do the absorption test results meet the specified requirements?
  Yes____ No____
Remarks ____________________________________________________________________________

(5) If a test specimen fails, was the appropriate retest performed?
  Yes____ No____
Remarks ____________________________________________________________________________

D. MANUFACTURE

(1) Do the materials used in the production of the product meet the applicable specifications? Cement, Aggregates, Reinforcement, etc. Yes____ No____
Remarks ____________________________________________________________________________

(2) Does size of wire/steel, spacing and minimum cover conform to specifications or approved drawings? Yes____ No____
Remarks ____________________________________________________________________________

(3) Are dimensions, laps and welds of wire/steel within tolerance?
  Yes____ No____
Remarks ____________________________________________________________________________

(4) Are curing facilities adequate? Yes____ No____
Remarks ____________________________________________________________________________

(5) Is reinforcing wire/steel exposed? Yes____ No____
Remarks ____________________________________________________________________________

(6) Is the position of the reinforcing wire/steel in the product within specifications?
  Yes____ No____
Remarks ____________________________________________________________________________
(7) Is the spacing center to center of circumferential reinforcement within specifications?  Yes____ No____  
Remarks ________________________________________________________________  

(8) Is the product substantially free of fractures, cracks and surface roughness?  Yes____ No____  
Remarks ________________________________________________________________  

(9) Does the product meet dimensional requirements?  Yes____ No____  
Remarks ________________________________________________________________  

(10) Is the following information clearly marked on each section of product?  
A. The specification designation?  Yes____ No____  
B. The date of manufacture?  Yes____ No____  
C. The name or trademark of the manufacturer and identification of plant?  Yes____ No____  
D. Are the letters Q.C. affixed to each piece of product as evidence that the required Q.C. procedures have been performed?  Yes____ No____  
Remarks ________________________________________________________________  

(11) Do shipping tickets/documents contain a statement that the product shipped has been tested, inspected and approved under an approved producer QC acceptance program?  Yes____ No____  
Remarks ________________________________________________________________  

E. REPAIRS  

(1) If repairs were necessary, are the repairs sound and properly finished and cured?  Yes____ No____  
Remarks ________________________________________________________________  

(2) Is the repair material in accordance with Section 218 of the Road and Bridge Specification?  Yes____ No____  
Remarks ________________________________________________________________

Appendix G: Polyethylene Pipe Plant Monitor Report

DATE________________________
MONITOR PERIOD ________________
MANUFACTURER __________________
LOCATION DISTRICT ______________

This form is designated to assist those in the review process. A number of questions are provided for this purpose. The applicable specifications contain greater detail than this checklist, and are required to assure that all is in compliance. Use both in this monitoring effort.

A. Does the producer have the VDOT Approved QA/QC plan available and is the plan current?
   Yes _____ No _____
   Remarks ________________________________________________________________

B. Does the producer maintain a Department approved Quality Control Form for all products produced for VDOT projects? Yes _____ No _____
   Remarks ________________________________________________________________

C. Is there written documentation that the following tests are being performed in accordance with AASHTO M252 and M294?

1. Workmanship Yes _____ No _____
   Remarks ________________________________________________________________

2. Tubing Dimensions Yes _____ No _____
   Remarks ________________________________________________________________

3. Perforation Dimensions Yes _____ No _____
   Remarks ________________________________________________________________

4. Pipe Stiffness Yes _____ No _____
   Remarks ________________________________________________________________
5. Pipe Flattening  
   Yes _____  No _____

SIGNATURE OF PERSON CONDUCTING MONITOR REVIEW

________________________

TITLE
Appendix H: Quality Control Plan Review Check List

Plant Name: ________________________________

Location: ________________________________

Date: ________________________________

Reviewer: ________________________________ Reviewer’s Section: ________________________________

Description: This Quality Control (QC) Plan Review Check List is to be used by the VDOT Monitor to assess the completeness of the Quality Control Plan submitted by the miscellaneous precast concrete or concrete pipe producer. If the QC Plan is deemed complete, the QC Plan can be approved and the producer can make product for VDOT projects according to the instructions.

Note: N/A = Not Applicable

Does the QC Plan have a:

Cover sheet specific to the Facility with the latest revision date: Yes No

Statement of Commitment to Quality Control: Yes No

Plant Personnel Organizational Chart: Yes No
(Including Plant Manager, QC Technician/Manager/Director and Personnel Qualifications)

Plant Organization (line of reporting) Yes No

Types of Precast concrete items produced for VDOT projects Yes No

Records:

Types of Records kept Yes No

Retention time of records Yes No

Materials Section – Are the location and retention time of the following documentation included?

If purchasing concrete from a concrete producer not on site, is the concrete producer an approved source? Yes No N/A

Cement Supplier’s name, location and mill certificates Yes No N/A

Fine and Coarse Aggregates

  Stamped Delivery Tickets or Certifications kept on file Yes No N/A
  Documentation of Gradations and Moisture checks Yes No N/A
  Frequency of Visual Inspections Yes No N/A

  Admixtures: Product Data sheets and types of admixtures used Yes No N/A

  Water quality Yes No N/A

H-1
Welded Wire Fabric fabrication procedure  Yes  No
Steel/Rebar/Epoxy-coated rebar mill certifications  Yes  No
Grates, frames and covers
  Certifications under an approved program  Yes  No  N/A
Materials Storage  Yes  No
  Does the QC Plan state how each material used will be stored?
Form Work  Yes  No
  Does the QC Plan provide details of how forms are cleaned, stored and prepared for the next pouring operation?
Set-up Inspection  Yes  No
  Does the QC Plan provide information on how the equipment is prepared prior to form set-up; equipment available and functioning properly, etc.?
Prepour Inspection
  Form set-up  Yes  No
  Product set-up  Yes  No
Postpour Inspection  Yes  No
Batching  Yes  No
Curing:  Steam  Air  Other________
  Cold Weather curing procedures: ________________________________
  Hot Weather curing procedures: ________________________________
Finished Product Inspection  Yes  No
  Does the QC Plan describe how the finished product is inspected?
Product Storage and Shipping  Yes  No
  Does the QC Plan describe how the product is stored and how the product is shipped including any precautions and inspection that is performed?
Patching
  Level of Patching  Yes  No
  Brand Name of Patching Material used  Yes  No
  Procedure for patching in hot and cold weather  Yes  No
Problem Resolution Procedure  Yes  No
  Does the QC Plan outline a procedure to follow when problems involving production, testing, product meeting specifications, etc. are encountered?
Quality Control Testing Frequency and Test Method
  Does the QC Plan define the testing performed to ensure
product meets specifications?

Making cylinders/curing AASHTO T126 ASTM C31
Temperature of Concrete ASTM C192 ASTM C1064
Slump Test ASTM C143

Air Content
  Pressure Meter ASTM C231
  Volumetric Meter ASTM C173

Absorption tests AASHTO T280 ASTM C497

Strength tests AASHTO T280 ASTM C39
  ASTM C497

Scale/Balance calibration frequency Yes No

Frequency of Hopper/Chute Inspection Yes No

Consequences of failing tests Yes No
  What is done with the product when failing tests are encountered?

Mix Designs Yes No

Identification and Handling of unacceptable units Yes No

Product stamping and Shipping Ticket with identifications Yes No

Appendix I : Virginia Department of Transportation/Materials Precast Concrete Repair Manual

INTRODUCTION

Precast concrete, as a manufactured material, will not be 100% defect free; however, with proper quality control (QC) repairs can be minimized. Repaired precast concrete can be just as good as structurally sound concrete not needing repairs. The purpose of this manual is to provide guidance in the identification and repair of defects in precast concrete units. The manual will also help identify the precast piece and help one identify the piece as the one ordered.

ACCEPTABLE MATERIALS FOR REPAIR

Materials used in repairs should be listed on the proper VDOT Materials Division Approved List numbers 28, 29 or 31. The lists can be found at http://www.virginiadot.org/business/resources/Materials/Approved_Lists.pdf Repair materials must be applied and cured in accordance with the manufacturer’s recommendations.

DEFINITIONS

Structural Defect – Broken corners, large spalls and defects that expose rebar
Cosmetic Defect – Chips, bug holes, surface defects, fractures and small spalls that do not expose any reinforcement. Defects that do not affect the integrity of the structure, i.e. only affect the look of the structure.
Bug Holes – Entrapped air voids at the surface. The air voids should be small in size less than ¼ inches (6 mm) in diameter.

PRECAST CONCRETE UNITS

Basics – Typically, the design strength of a precast structure is at least 4000 PSI (30 megapascals) at 28 days and 6 ± 2% air content. Units should not be shipped until 85% design strength is achieved. Some units will have exposed rebar for tying into adjacent cast in place structures.

Endwalls – The basic look of an endwall is rectangular with a thicker base (Photo 1 & 2). There will also be at least one opening for a pipe connection. The opening could be circular, elliptical or arched. Larger endwalls will most likely have wings. The endwall should have neat, clean edges without spalls, cracks or exposed reinforcement. Pipe openings shall not exceed the outside cross sectional dimensions of the pipes by more than a total of 8 inches (200 mm) regardless of the placement of pipes, the angles of intersection, or the shapes of the pipes.
Box Culverts – There are numerous looks to box culverts. The typical cross section should have a rectangular look to it. The number of boxes in a typical section is the type of culvert. Two boxes make a double box culvert.

The box culvert should be free of visible defects and have neat, clean edges.

Photo 3 - Box Culvert
The top edge needs to be patched before item can be installed.
This box culvert (Photo 4) can be patched to cover the exposed rebar. More severe damage may be cause for rejection or may be repaired in accordance with a procedure approved by the Engineer. Repair procedures may be submitted on a case-by-case basis.

**Top Units** – The top unit will be circular (Photo 5) or rectangular with various openings or grates. The joint will be of fabricator’s design meeting approval of the Engineer. Joints are to be sealed with mortar, rubber gasket, or butyl rubber. The unit shall be free of visible defects and have neat, clean edges.
Drop Inlets

**DI-2** – Will have a similar look to what is pictured (Photo 6) but can have slight modifications depending on its use.

![Photo 6 - DI-2](image)

**Photo 6 - DI-2**

**DI – 3, 4** - The item will come in several pieces. The main section should be a rectangular box. The box will have an IC-2 frame and cover. One side of the box will be open with the bottom having a smaller opening (Photo 7). The main piece will also contain dowel holes used to connect to the curbing. The second piece is the face block (Photo 8). The face block will have at least two loops cast in the face. Face blocks should be sealed with grout or polysulfide from the appropriate approved list. The pieces shall be free of visible defects and have neat, clean edges.

![Photo 7 - DI-4](image) ![Photo 8 - Face Block](image)
**DI – 5** – This item will be slanted (Photo 9) to fit a ditch. Unit should not be placed in traffic. The unit shall be free of visible defects and have neat, clean edges.

![Photo 9 - DI-5](image)

**DI – 7** – Grate design can vary depending on if unit will be subject to traffic loading or not.

![Grates](image)
Photo 10 - DI-7

DI- 10, 14 (Photo 11) – Unit is to be used with median barriers.

Photo 11 - DI-10

DI – 12 – Unit should not be placed in traffic loading conditions. Grate bars should be installed parallel to ditch flow (Photo 12).
**Photo 12 - DI-12**

**Taper units** – Circular units that are attached under a manhole frame. The unit will taper from a larger section to a smaller section (Photo 13). The unit shall be free of visible defects and have neat, clean edges.
The taper should be flush with its mated surface. This item should be repaired before installation.
**Riser** – Circular units that are attached under a manhole frame (Photo 14). The unit shall be free of visible defects and have neat, clean edges.

**Photo 14 - Riser**

**Base Units (Photo 15)** – Openings for pipe will be a minimum of 4 inches (100 mm) to a maximum of 8 inches (200 mm) larger than the outside diameter of proposed pipe. Joints are to be sealed with mortar, o-ring gasket, or butyl rubber.

**Photo 15 – Base Unit**
Manhole Tee Bases (Photo 16) – Riser section is to have a minimum wall thickness of 5 inches (125 mm). Base section should be same class and strength as the adjoining pipe culvert. Tongue and groove joints are to be of identical design as adjoining pipe culvert.

Photo 16 - Manhole Tee Base

Flared End Section – The unit will have either a tongue end (Photo 17) or a groove end (photo 18). The unit shall be free of visible defects and have neat, clean edges.
Used Barriers: Delineators and other required reflective materials are to be replaced with new material and the marks/blemishes caused by the removal are to be repaired or acceptably covered.

Used barrier sections should not be expected to look like new. They should be cleaned or coated sufficiently to afford good visibility and uniformity of appearance. The barrier sections must be structurally sound with no concrete missing along the top surface and no through cracks.

Cosmetic Repair: Minor chips, small spalls or bug holes

- Areas that require repair are to be clean, sound and free of contaminants
- Provide an aggregate fractured surface
- When using a water-based repair material, saturate the repair surface to SSD condition
- Follow the manufacturer’s instruction for patching for an approved repair material
- Allow repaired unit to cure to at least 85% of design strength before moving.

Structural Repair: Large chips, spalls or exposed reinforcement

- Areas that require repair are to be clean, sound and free of contaminants
- Provide an aggregate fractured surface
- Remove concrete a minimum of 1 inch (25 mm) beyond all exposed reinforcement
- Saturate the repair surface to provide an SSD (Saturated, Surface-Dry) condition, if using a water-based repair material
- Follow the manufacturer’s instruction for patching for an approved repair material
- Allow repaired unit to cure at least 85% of design strength before moving.
PIPE

Acceptable non-repaired pipe: Should have neat edges, corners and be free of visible defects.

Determination of Repairs to Precast Units: Edge and Corner spalls are to be repaired to their original, neat lines. The mortar to be used for repair should closely match the color of the concrete unit if the unit is exposed. The manufacturer’s directions should be followed when patching the concrete unit. Special precautions should be taken in hot or cold weather.

Cracks of less than 12 inches (300 mm) in length and less than 0.01 inches (.25 mm) in width may be repaired with mortar. Units having full depth cracks or larger than those noted above, shall be rejected or may be repaired in accordance with a procedure approved by the Engineer. Repair procedures may be submitted on a case-by-case basis.

When the effectiveness of a connection is reduced, but involves damage to less than 20% of the longitudinal dimension of that connection, repair may be performed as in the paragraph above. The connection refers to the spigot, bell, tongue or groove of pipe.

Photo 19 - Spigot out of Round
The above pipe can be repaired following the proper procedure.

Photo 20 - Repairable Pipe

Photo 21 - Non-Repairable Pipe
Pipe that has as much damage as the pipe above shall be rejected and not repaired.

Repair to spalls in the inner barrel will be allowed in the acceptable limits at the male and female ends of joint. Spalls on the inner barrel may be considered cosmetic if reinforcement is not revealed within 1.5 times the joint depth from the end of pipe. Minor spalls at the lift hole may be repaired when the lift hole is plugged. Spalls with a size greater than 2 inches (50 mm) or have exposed rebar shall require structural repairs.

If a pipe section exhibits a through wall crack, it shall be rejected (Photo 22); except that a single end crack that does not exceed the depth of joint will be permitted. On a case-by-case basis, repair procedures for rejected pipe may be submitted for approval by the Engineer. Non-through wall cracks for pipe not tested but part of an approved lot will be accepted according to ASTM C76.

Photo 22 - Throughwall Crack

Pipe sections that exhibit signs of manufacturing defects such as honeycombing (Photo 24) or mixture insufficiencies exposing the reinforcement cage (Photo 23) shall be rejected. This statement does not include exposed end tips (Photo 25). Exposure of end tips shall not be justification for rejection.
Photo 23 - Exposed Rebar

Photo 24 - Honeycombing
Photo 25 - Exposed Tips

Note: The rejection criteria for length and width of cracks are taken from AASHTO M199. The 20% criteria for keyways is a collective judgment.

**Cosmetic Repair:** Minor chips, small spalls or bug holes

- Areas that require repair are to be clean, sound and free of contaminants
- Provide an aggregate fractured surface
- Saturate the repair surface to provide an SSD condition, if using a water based repair material
- Follow the manufacturer’s instructions for an approved repair material
- Allow repaired pipe to cure to at least 85% of design strength before moving

**Structural Repair:** Large chips, spalls or exposed reinforcement

- Areas that require repair are to be clean, sound and free of contaminants
- Provide an aggregate fractured surface
Photo 26 - Pipe with Formwork
- Remove concrete a minimum of 1 inch (25 mm) beyond all exposed reinforcement
- When using a water-based repair material, saturate the surface to provide a SSD condition
- Follow the manufacturer’s instructions for an approved repair material

Photo 27 - Pipe with Patch
Allow repaired pipe to cure to at least 85% of design strength before moving.
When damage to the tongue or groove involves 20% or more of the longitudinal dimensions, the repair must be doweled into the undamaged portion of the unit using EP-4 epoxy and repaired with hydraulic cement concrete (cured in accordance with the provisions of section 404 of the specifications) or with an approved patching material.

Photo 28 - Bad Patch on Pipe

Special Thanks to Pennsylvania Department of Transportation for use of their manual, Illinois Department of Transportation for use of their manual and the Precast Concrete Association of Virginia.

Appendix L: Precast Violations (NCR) Categories

1. Improper Vibration Technique: (1 point)
   - Dragging or moving concrete by using the vibrator instead of shoveling it into corners.
   - Casting vibrator across concrete instead of a proper vertical timed motion.
   - Leaving vibrator in one spot too long per ACI-309.1R.
   - Excess form oil.

2. Concrete Placement: (3 points)
   - Concrete dropped into forms from too great a height.
   - Delays in pouring a unit that may result in a cold joint or poor concrete workability. (Using
     SCC a pour line may develop that could potentially be confused for a cold joint)

3. Pre-Pour Inspection: (3 points)
   - Failure to check forms dimensionally, gaps in formwork, worn or damaged parts, cleanliness
     of forms (debris removed).
   - Failure to check correct rebar placement with clearances checked.
   - Failure to check forms and any block-outs are secure from moving during pour.

4. Post-Pour Inspection: (3 points)
   - Failure to inspect finished product for workmanship, bug holes or honeycombing, exposed
     rebar, dimensionally within tolerance.
   - Excess concrete paste or flashing exceeding specified limits.
   - Failure to inspect appearance and color when applicable. (Architectural, detailed on plans,
     exposed to visual observation in service or above ground).
   - Forms not inspected for damage, concrete debris or adhesion, loose or worn components.

5. Workmanship: (3 points)
   - Improper troweling, smoothing, stamping or architectural finishes per design specifications.
   - Patches are not uniform, don't blend in with surrounding area, and color and design don't
     match. (For architectural products and products exposed to visual observation in service).
   - Concrete patch used is not an approved patch material.
   - Surface is not prepared to hold patch and patch is not cured and checked before shipping.
   - No patching procedure in place and not submitted to VDOT per QC plan.

6. Concrete Mix Design: (4 points)
   - Unable to trace mix design to an approved mix design in the QC plan.
   - Tests not performed as identified in QC plan and/or not in accordance with ASTM procedure.
   - Concrete is not the correct design strength for the item produced.
   - Test equipment is not calibrated and is not used correctly.
   - Concrete is being used without slump, air and temperature tests completed.

7. Documentation: (4 points)
   - Pre and Post-Pour sheets not completed.
   - Cylinder breaks, slump, air and temperature are not recorded.
   - Mix designs, admixture certifications, stone and sand certifications, Fly ash certifications,
     steel certifications including rebar, lifting deives, plastic tie wire and epoxy coated tie wire,
     welded wire mats and well water tests not maintained on file at the plant.
   - Non Compliance with Buy America (5 points).
8. Storage and labeling of products: (3 points)
   - Products are not stored correctly, not stored with dunnage placed if required.
   - Unacceptable products not stored in a separate area and not marked accordingly.
   - Damaged products not marked accordingly for repairs.
   - Products not labeled correctly with the company name, location, description of the piece or size and class in accordance with the QC plan.

9. Material Storage: (4 points)
   - Materials used for production shall be stored per manufacturers or VDOT specifications and care shall be taken to avoid cross contamination, weather, including heat and cold, excess moisture, or anything detrimental to the material.
   - Steel not stored per VDOT specifications, rebar and wire mesh not off the ground, metal products (castings) approved for VDOT use not separated from non-VDOT material.

10. Approved Stamped Shop Drawings: (4 points)
    - Failure to provide the QA Inspector shop drawings for review prior to the beginning of production. Note: All pages shall have an approval stamp and be signed or initialed. Errors or revisions will be re-submitted to the Engineer for approval.
    - The plant QC department operating during production without a set of detailed approved drawings.

11. Shipping Tickets: (3 points)
    - A shipping ticket without the QC statement and unsigned.
    - Items listed on the shipping ticket that don’t include all information ie. designation, location, square or linear feet totals shown if required.
    - Cast date not included on shipping ticket.

12. Shipping: (5 points)
    - Shipping products that do not meet shipping strength without the approval of a VDOT Engineer.
    - Shipping products with dimensions that do not conform to design tolerances.
    - Shipping of a QC stamped product without a complete post-pour inspection.
    - Shipping unstamped products for a known state project.

13. Non-Professional Conduct: (4 points)
    - Contentious disputes, insults, or disrespectful behavior directed towards the VDOT inspector in the performance of his duties.
    - Disregard of safety concerns expressed by the QA Inspector during visits to the plant.

14. Failure to address NCR within 5 business days (one point)

15. One additional point will be accessed for problems discovered by Field inspection staff

16. Violations warranting immediate removal from Approved List No. 34 for one year
    - Supplying products not approved by VDOT for known VDOT projects.
    - Shipping precast products rejected by QA Inspector.
    - Producing products for VDOT project without approved VDOT mix designs.
    - Purchasing materials for a VDOT project from a non VDOT approved source.
* This is not meant to be an all-inclusive or complete list but an example list of types of violations that could result in an NCR being written by QA Inspector. The QA Inspector will determine the most appropriate category that fits the violation or nonconformance. An additional one point will be assessed to the violation if it is discovered at a VDOT project site.

See attached NCR report
