# ***Chapter 1 - Introduction***

## ***1.1 Background***

The Virginia Department of Transportation (VDOT) has developed the 2002\* VDOT Drainage Manual to provide designers a valuable reference and tool for the drainage design of Virginia's roadways and to document VDOT's policies and procedures for standard roadway drainage design.

This edition of the VDOT Drainage Manual constitutes a major technical update and compilation of the existing VDOT Drainage Manual, the AASHTO Model Drainage Manual, and other resources and has been prepared in electronic format to be made available on the Internet at the VDOT website. VDOT's Hydraulics Section prepared this edition of the manual.

The objectives of the manual are to:

- Provide concise technical information for drainage designers
- Establish VDOT's policies and procedures for drainage design
- Provide an educational tool for aspiring drainage designers and instructors
- Provide in electronic format, available on the World Wide Web for viewing and downloading
- Provide guidelines to enhance the quality of drainage design submittals to VDOT

---

\* Rev. 1/17

## 1.2 Overview

### 1.2.1 Purpose

This manual is intended as an operational handbook for use in hydrologic and hydraulic analysis. Design concepts, policies and procedures, criteria, and examples are condensed and written for use by the designer. Where appropriate, relevant hydraulic design publications are referenced. While it is essential that the user of this manual is familiar with the methods of analysis and design of highway drainage for VDOT, the text provides detailed instructions and criteria for the development of analysis and design in most cases. An exception to this rule is the case where another source document expounds upon the method in great detail. In this case, the manual directs the user to the source document or provides a brief synopsis of the subject.

This manual is intended for use in the development of VDOT highway drainage and stormwater management\* design projects by Department staff, consultants, and Virginia's municipalities. Educational organizations may use the manual as instructional text in design application. The manual gives the designer a basic working knowledge of hydrology and hydraulics, illustrated with example problems. Basic design elements are included so that the designer can design highway drainage with minimal assistance. However, this manual cannot provide guidance on complex hydrologic or hydraulic problems and is no substitute for experience, formal training, or engineering judgment.

The Department recognizes the difficulty in accurately defining or predicting the dynamic properties of nature. There are numerous methods of analysis available and it is recommended that as many method(s) as may be appropriate be employed in the solution of a problem. Further, all hydraulic designs must give consideration to economic, aesthetic, and environmental aspects of the given design.

Complete documentation of all analyses is essential and must be perpetually maintained. The rapid development of technology in the fields of hydrology and hydraulics necessitates a periodic review and, if necessary, update of all analyses prior to construction of the facility. All analysis completed more than three years before construction must be reviewed prior to construction.

### 1.2.2 Manual Layout/Chapter Templates

Typical section headings for the main hydraulic chapters are identified in Table 1-1, which indicates the typical contents of the chapter sections.

The Design Concepts section for each technical chapter is generally based on the AASHTO *Model Drainage Manual*. As such, the material is included for theoretical background and may not conform exactly to VDOT methodology, terminology, or nomenclature. When practical, the text is revised to be consistent with VDOT methodology and policy.

<b>Sections</b>	<b>Contents</b>
Introduction	Objectives
Policy	Define Course of Action for VDOT, State, Federal and Local Policy
Design Criteria	Specify Standards by which Policy is Carried Out
Design Concepts	Design Considerations/ Guidelines Theory and Equations Requirements Figures <u>Necessary</u> to Support Procedures or Examples
Design Procedures & Examples	Step-by-Step Procedures Specific Design Considerations Specific Software Solutions Figures <u>Necessary</u> to Support Procedures or Examples
References	Sources of Information / Bibliography
Appendices	All Figures, Forms and Design Aids <u>Not Necessary</u> to be in Concepts or Procedures Drainage Design Memoranda Definitions Checklists Symbology and Nomenclature

**Table 1-1 Chapter Template and Contents**

### **1.3 Drainage Design Memoranda**

Drainage Design Memoranda contain instructional and informational guidance related specifically to drainage design. The instructions and information contained in these memoranda are subject to relatively frequent changes and have therefore intentionally **been**\* excluded from the main body of text in this manual. These memoranda are all contained in Chapter 15. All Technical Supplements, and Drainage Manual Errata Sheets published prior to issuance of this manual are now included in the manual and are hereby voided.

\* Rev. 7/14

## 1.4 References

The manual provides references at points where the designer may need more detailed source material. The reference section at the end of each chapter includes these source documents, as well as a listing of those documents, which are recommended additions to the designer's library of references.

The following documents are an integral part of VDOT roadway and drainage design:

VDOT Reference Documents (all latest editions)

- VDOT Road and Bridge Standards, Volume I and II
- VDOT Road and Bridge Specifications
- VDOT Instructional and Informational Memoranda
- VDOT Road Design Manual
- Virginia Stormwater Management Program\* Regulation (9VAC25-870)
- Virginia Erosion and Sediment Control Regulations (9VAC25-840)
- Virginia Erosion and Sediment Control Handbook
- Virginia Stormwater Management Handbook, Volumes I and II
- VDOT Survey Instruction Manual
- VDOT Stormwater BMP Design Manuals of Practice
- VDOT Annual Standards & Specifications for Erosion and Sediment Control and Stormwater Management

Compliance with the following applicable laws and agencies' regulations and policies are required:

- Virginia Department of Transportation
- Virginia Stormwater Management Program Regulation
- Virginia Erosion and Sediment Control Regulations
- State Drainage Law
- Code of Federal Regulations
- FHWA Federal Aid Policy Guide
- Federal Emergency Management Agency
- Environmental Protection Agency Regulation
- National Pollution Discharge Elimination System (NPDES)
- Department of Environmental Quality

---

\* Rev. 3/19

## **1.5 User Instructions**

This manual is divided into 17 chapters, each dealing with a major category of hydrologic or hydraulic analysis. Each chapter is further divided according to specific elements of the subject. Departmental policy and design criteria are presented in each chapter as they relate to the specific subject matter.

The downloaded electronic version of the Drainage Manual and its revisions will be considered the official reference document in agreements with consultants. The manual can be downloaded from VDOT's website at the following location: <http://www.virginiadot.org/business/locdes/hydra-drainage-manual.asp>. The authors of this manual have strived to maintain the accuracy and reliability of the information and procedures presented herein. However the execution of engineering design involves the judgment of the designer, and only he or she can ascertain whether a technique or item of information can be applied to a given situation. Therefore, neither the Department nor any contributor accepts responsibility for any real or alleged error, loss, damage, or injury resulting from use of the material contained herein.

References to specific computer programs, AASHTO guidelines, manual, and regulations are included in this manual. It is expected that the designer will be knowledgeable in the use of the referenced items. This manual cannot incorporate computer program user manuals or remain current with these programs and the latest drainage-related Federal regulations. The designers should keep themselves up-to-date by contacting either their local, State, or Federal hydrology/hydraulic departments.

This manual is published in U. S. Customary (English) units. In most cases all units, equations, tables, and figures are given in English units. In a few instances, some existing metric information was not converted to English units. The metric units are given so that the material could still be included in the manual. In most cases, computer software is available that allows the use of English units that can be used to obtain the required information.

Information in this Manual may be supplemented and/or revised by drainage related Location and Design Instructional and Informational Memorandums (IIM's). Information in these IIM's shall supersede that noted in this Manual unless otherwise approved by the State Hydraulics and Utilities Engineer. Where language in various sections of this Manual conflict, the more stringent language shall dictate unless otherwise approved by the State Hydraulics and Utilities Engineer.

---

\* Rev. 3/19

## ***1.6 Revisions and Updates***

VDOT plans to issue updates and revisions to this manual which will be found at the VDOT website. Updates and revisions would normally be anticipated no more than twice a year. Users of the manual should review the VDOT website periodically and prior to beginning design or preparing a plan submittal, to determine the date of the most recent updates. Users that cannot access the information on the Internet may phone the VDOT Hydraulics Section in the nearest district office or Central Office in Richmond, Virginia. When revisions are available, the user will be notified via an Errata Sheet file on the VDOT website at the location where the manual may be viewed and/or downloaded. These files also briefly describe each revision. All revised material (where possible) will be shaded so the user will be able to recognize it as having been changed. The shaded material within any given chapter will remain shaded until the next revision, at which time all previous shading in that chapter will be removed.

## **1.7 Acknowledgements**

The Department gratefully acknowledges the following for their contribution towards the preparation of this Manual:

- American Association of State Highway and Transportation Officials (AASHTO Drainage Manual, Highway Drainage Guidelines, and other publications)
  - Executive Committee
  - Hydrology and Hydraulics Technical Committee
- Federal Highway Administration
- Federal Emergency Management Agency
- United States Geological Survey
- United States Army Corps of Engineers
- Virginia Department of Transportation –
  - Ms. Victoria “Tory” Bains, P.E., State Hydraulics and Utilities Engineer
  - Mr. Chris Swanson, P.E., State MS4/Stormwater Management Engineer
  - Mr. Roy Mills, Former State Hydraulics Engineer and Member AASHTO Hydrology and Hydraulics Technical Committee
- Virginia Department of Conservation and Recreation – Division of Soil & Water Conservation
- Virginia Department of Environmental Quality
- Materials furnished by other state and federal agencies
- Research publications and materials furnished by the private sector
- Photo on cover courtesy of Virginia Department of Game and Inland Fisheries. Photographed by Mr. Dwight Dyke. Big Tumbling Creek at the Clinch Mountain Wildlife Management Area.

The Department’s Hydraulic Section wishes to express its appreciation to all contributors who assisted in the development of this manual.

## **Definitions:**

<u>Average Land Cover Condition</u>	A measure (in percent) of the average amount of impervious area within a watershed.
<u>Backshore</u>	The backshore is the area of the coastal zone that extends from the limit of high tides and storm waves to the base of a cliff or beach ridge.
<u>Barrier Beach</u>	A bar essentially parallel to the shore, which has been built up so that its crest rises above the normal high water level.
<u>Base Flood</u>	The 100 year flood. This term is used to be consistent with the language in FHWA and FEMA guidance.
<u>Base Flow</u>	The typical flow that will be encountered in a stream that will not be exceeded for 25% of the year.
<u>Bridges</u>	(1) Structures that transport traffic over waterways or other obstructions, (2) Part of a stream crossing system that includes the approach roadway over the floodplain, relief openings, and the bridge structure, (3) Structures with a centerline span of 20 feet or more; however, structures designed hydraulically as bridges are considered bridges, regardless of length.
<u>CBR Tests</u>	The California Bearing Ratio (CBR) test consists of measuring the relative load required to cause a standard (3 square inches) plunger to penetrate a water-saturated soil specimen at a specific depth.
<u>Channel</u>	A natural or manmade waterway (includes culverts and storm sewer systems).
<u>Code of Federal Regulations</u>	Codifies and publishes at least annually Federal regulations currently in force. The CFR is kept up to date by individual issues of the <i>Federal Register</i> . The two publications must be used together to determine the latest version of any given rule.

Common Enemy Doctrine

Common law rule recognized by some states, pertaining to the disposal of surplus or excess surface waters, which holds that such waters are a “common enemy”; therefore, the land owner has the right to protect his lands from such waters coming from higher lands. Under this rule, surface waters are regarded as a common enemy, which each landowner may fight as he deems best and without regard to the harm that may be caused to others.

Common Laws

The body of principles which developed from immemorial usage and custom and which receives judicial recognition and sanction through repeated application.

Critical Depth

Critical depth is the depth at which the specific energy of a given flow rate is at a minimum. For a given discharge and cross-section geometry there is only one critical depth.

Culvert

(1) A structure which is usually designed hydraulically to take advantage of submergence to increase hydraulic capacity, (2) A structure used to convey surface runoff through embankments, (3) A structure, as distinguished from bridges, which is usually covered with embankment and is composed of structural material around the entire perimeter, although some are supported on spread footings with the streambed serving as the bottom of the culvert, (4) A structure which is traditionally 20 feet or less in centerline length between extreme ends of openings for multiple boxes; however, a structure designed hydraulically as a culvert is treated as a culvert, regardless of length.

Deep-water Wave

A wave in which the depth of water is greater than one-half the wavelength.

Department

The Virginia Department of Transportation.

<u>Detention Basins</u>	A basin or reservoir incorporated into the watershed, whereby runoff is temporarily stored, thus attenuating the peak of the runoff hydrograph. A stormwater management facility that impounds runoff and temporarily impounds runoff and discharges it through a hydraulic outlet structure to a downstream conveyance structure.
<u>Discharge Point</u>	The location at which stormwater and/or a pollutant leaves the project area. Also “point of discharge”.
<u>Downcast</u>	The direction of predominant movement of littoral currents and transport.
<u>Embayment</u>	An indentation in a shoreline forming an open bay.
<u>English Rule</u>	Based on the doctrine of absolute ownership of water beneath the property by the landowner. The English Rule is analogous to the common enemy rule in surface water law.
<u>Eutrophication</u>	The process of over-enrichment of water bodies by nutrients often typified by the presence of algal blooms.
<u>Executive Orders</u>	Federal laws that are issued by the President of the United States.
<u>Federal Register</u>	A daily publication of the Federal Government making federal regulations, legal notices, Presidential Proclamations, Executive Orders, etc., known to the public as they are proposed and subsequently issued.
<u>Fetch</u>	The length of unobstructed open sea surface across which the wind can generate waves.
<u>Flood Insurance Study</u>	Established the regulatory floodplain and floodway.
<u>Flow Type</u>	The USGS has established seven culvert flow types which assist in determining the flow conditions at a particular culvert site.
<u>Foreshore</u>	The foreshore is the area of the coastal zone that extends from the low-tide level to the limit of high tides and storm-wave effects.

Free Outlet

A free outlet has a tailwater equal to or lower than critical depth. For culverts having free outlets, lowering of the tailwater has no effect on the discharge or the backwater profile upstream of the tailwater.

Headland

A headland is the seaward most projection of land from the shoreline. Because headlands project out into waves and currents, headlands are usually subjected to greater erosion forces. Headlands may be the remnants of submerged ridgelines or be composed of erosion resistant materials.

HUC6

A watershed unit established in the most recent version of Virginia's 6th Order National Watershed Boundary Dataset.

Hydraulic Grade Line

The elevation to which the water can be expected to rise within a storm drain (pressure head + elevation head)

Impervious Surface or Cover A surface composed of any material that significantly impedes or prevents natural infiltration of water into soil.

Impervious Area

The area (square feet or acres) of the site composed of an impervious surface.

Improved Inlet

An improved inlet has an entrance geometry, which contracts the flow as it enters the barrel thus increasing the capacity of culvert. These inlets are referred to as either side- or slope-tapered (walls or walls and bottom tapered).

Karst Topography

Irregular topography characterized by sinkholes, stream-less valleys and streams that disappear into the underground, all developed by the action of surface and underground water in soluble rock such as limestone.

Lakeshore

The strip of land from a lake shoreline inland to the first major change in terrain features. Except for tidal effects, large lakes and reservoirs of 100 mi<sup>2</sup> or more in area have shores that require many of the same type considerations as ocean bays and estuaries. Analogous to coastal zone tides, some lakeshores are subject to significant changes in water surface elevation due to operation practices.

Land Disturbance or  
Land-Disturbing Activity\*

Any man-made change to the land surface that may result in soil erosion or has the potential to change its runoff characteristics, including the clearing, grading, excavating, transporting, and filling of land.

Limits of Disturbance or LOD

The area encompassing a regulated land-disturbing activity on a project or site and subject to regulation under the Virginia Erosion and Sediment Control Program. The area within the limits is shown on ESC Plans and reported in the registration statement for the VPDES CGP as Primary estimated area to be Disturbed

Linear Development Projects

Those land-disturbing activities linear in nature such as, but not limited to, highway construction/maintenance projects/ activities, construction/maintenance of stormwater channels and stream restoration projects.

Longshore

Currents or sediment transport that move parallel to the shoreline.

Managed Turf

Means portions of roadway rights-of-way that are pervious and do not meet the definition of open space.

Manmade Channel

A machine/hand-defined landform (i.e., roadside ditch, EC-2/EC-3/paved/concrete/ riprap lining, and outfall important) or manufactured conveyance structure (i.e., storm sewer pipe, culvert, inlet) located in VDOT R/W or municipal drainage easement, as part of a given roadway improvement project, subdivision or drainage improvement project, with requirements of access and maintenance to remain

---

\* Rev 9/19

clear of obstructions (i.e., debris, sedimentation, rigid structure), for the passing of design storm events applicable to the respective improvement and does not employ natural stream design principals.

Mean Higher High Water (MHHW)

MHHW is the average tidal elevation of the highest tidal elevation in a tidal day experienced over the 19-year metonic cycle.

Mean High Water (MHW)

MHW is the average high water elevation (both Higher High Water and Lower High Water) experienced over the 19-year metonic cycle.

Mean Lower Low Water (MLLW)

MLLW is the is the average tidal elevation of the lowest tidal elevation in a tidal day experienced over the 19-year metonic cycle.

Mean Low Water (MLW)

Tidal elevations and the vertical datums of coastal bathymetric maps are often referenced to Mean Low Water (MLW). MLW is the average low water elevation (both Lower Low Water and Higher Low Water) experienced over the 19-year metonic cycle.

Metonic Cycle

The Metonic cycle is a period of 19 years in which there are 235 lunations, or synodic months, after which the Moon's phases recur on the same days of the solar year, or year of the seasons.

Natural Channel

A landform defined by nature which conveys water, most commonly known as a tributary, stream, river, river delta or strait. A stream that has been modified using stream restoration principals may be considered a natural channel.

Non-Linear Projects

Those land-disturbing activities not considered linear in nature such as, but not limited to, parking lots, rest areas and District/Residency/ Area Headquarter complexes.

Normal Flow

Normal flow occurs in a channel reach when the discharge, velocity and depth of flow do not change throughout the reach. The water surface and channel bottom will be parallel. This type of flow will exist in a culvert operating on a constant slope provided the culvert is sufficiently long.

<u>Offsite</u>	Areas located outside of the VDOT right of way, easement or property boundary.
<u>Onsite</u>	Areas located inside of VDOT right of way, easement or property boundary.
<u>Open Space</u>	Means portions of roadway rights-of-way and permanent easements associated with a land-disturbing activity that, following construction, have either not been compacted by the activity; have had soil restoration; or have placed engineered soil mix, and will not be actively maintained. Typically, actively maintained means mowed more than four (4) times a year or fertilized. Surfaced area of stormwater facilities, with the exception of wet ponds, shall qualify as open space.
<u>Outfall</u>	The location where concentrated stormwater leaves the project area.
<u>Post-development</u>	Those conditions that will, or are expected to, exist after completion of the proposed land-disturbing activity/project.
<u>Post-development Impervious Area</u>	The amount of impervious area within the site that will or is expected to exist after completion of the proposed land-disturbing activity/project.
<u>Post-development Percent Impervious</u>	The amount of post-development impervious area within the site divided by the total area of the site times 100.
<u>Pre-development</u>	Those conditions that exist prior to commencement of the proposed land-disturbing activity/project.
<u>Pre-development Impervious Area</u>	The amount of impervious area within the site prior to commencement of the proposed land-disturbing activity/project.
<u>Pre-development Percent Impervious</u>	The amount of pre-development impervious area within the site divided by the total area of the site times 100.

Primary estimated area to be Disturbed\*

The area of regulated-land disturbing activities shown within the Limits of Disturbance on the Erosion and Sediment Control Plan and in the registration statement for the VPDES CGP.

Q<sub>1</sub> Control

This stormwater management measure is applied to channels with known or anticipated erosion problems as a quantity control measure. In design, the entire contributing drainage area to the proposed basin is captured and used to develop the detention volume for a 1-year storm.

Reasonable Use Rule

States in essence that each landowner is restricted to a reasonable exercise of his own right and a reasonable use of his property in view of the similar right of his neighbors.

Receiving Channel

The drainage facility that receives the stormwater runoff from the proposed land-disturbing activity.

Redevelopment

Means development on prior developed lands that have been previously utilized for residential, commercial, industrial, institutional, recreation, transportation or utility facilities or structures and that will have the impervious areas associated with those uses altered during a land-disturbing activity.

Regulated Land Disturbance Activities

Those activities that disturb one (1) acre or greater except in those areas designated as a Chesapeake Bay Preservation Area in which case the land disturbance threshold is 2,500 square feet or greater (unless the activity is specifically exempted by the VSMP Law and/or Regulations).

Regulated Site

The area within the project limits used to determine water quality requirements.

---

\* Rev 9/19

### Retention Basins

A basin or reservoir wherein water is stored for regulating a flood. It does not have an uncontrolled outlet. The stored water is disposed by such means as infiltration, injection (or dry) wells, or by release to the downstream drainage system after the storm event. The release may be through a gate controlled gravity system or by pumping.

### Riparian Doctrine

A doctrine that holds that the property owner adjacent to a surface water body has first right to withdraw and use the water. This doctrine may be set aside by a state's statutory law that holds that all surface waters are the property of the state.

### Roadway Section

The traveled way and associated shoulders, ditches, sidewalks, multi-use/shared use paths, back (cut) slopes and fore (fill) slopes

### Seiche

A seiche is an oscillatory wave generated by an impulse that disturbs the local water level equilibrium. The impulse may be a heavy rainfall, vessel passage, tsunami, flood discharge from a river, or a storm surge. Much like dropping a stone in to a tank of water, seiche waves oscillate back and forth, gradually diminishing in magnitude.

### Site

The area of proposed land disturbance (e.g., the construction limits) plus any R/W acquired in support of the proposed land disturbance activity/project. Any support areas within existing or proposed VDOT R/W associated with the proposed land disturbance activity/project and identified in the pre-construction SWPPP for the proposed land disturbance activity/project shall also be considered a part of the site. Permanent easements and/or other property acquired through the R/W acquisition process in conjunction with the proposed land disturbance activity/project may be considered a part of the site and utilized in the determination of the post-development water quality requirements provided such property will remain under the ownership/control of the VDOT and providing such property is so identified/designated on the proposed land disturbance activity/project plans and is legally encumbered for the purpose of stormwater

management. Areas channelward of mean low water in tidal Virginia shall not be considered part of a site.\*

Spread

The width of flow measured laterally from the flowline. With a curbed only section of roadway, the flowline is formed by the intersection of the pavement to the curb. With a curb and gutter section, it is the intersection of the gutter pan and the curb.

Statutory Laws

Enacted by legislatures to enlarge, modify, clarify, or change the common law applicable to particular drainage conditions. This type of law is derived from constitutions, statutes, ordinances, and codes.

Still-water Level (SWL)

SWL is used to refer to the imaginary elevation of water if all wave and wind action were to cease. SWL is used to define limits of coastal inundation during storm surges. Actual water levels are higher due to waves.

Storm Drain

A storm drain system is a drainage system installed to carry stormwater runoff, consisting of two or more pipes in a series connected by one or more drop inlets. An exception to this general rule is: one or more cross drain pipes connected by one or more drop inlets, "hydraulically designed" to function as a culvert(s) and not connected to a storm drain system.

Stormwater Conveyance System

A combination of drainage components that are used to convey stormwater discharge, either within or downstream of the land-disturbing activity.

Submerged

A submerged outlet occurs when the tailwater elevation is higher than the crown of the culvert. A submerged inlet occurs when the headwater is greater than  $1.2D$  where  $D$  is the culvert diameter or barrel height.

Surf Zone

The area where deep-water waves break (collapse) forming breakers. Note that on shallow sloped shorelines, waves may reform and more than one surf zone may be present.

---

\* Rev 9/19

<u>Tort</u>	A violation of a personal right guaranteed to the individual by law.
<u>Total land area of development</u>	The entire area to be disturbed as approved in the Stormwater Management Plan and reported on the VPDES CGP registration statement. See the definitions for <u>Regulatory Site</u> and <u>Site</u> .*
<u>Traveled Way</u> or <u>Travel Lane</u>	That portion of the roadway section, exclusive of shoulders, designated for vehicular use.
<u>Velocity Head</u>	A quantity of energy head proportional to kinetic energy of flowing water.
<u>Watershed</u>	The surface area, measured in a horizontal plane, draining to a specific point in a channel, stream, river or other such watercourse. Also often referred to as "Drainage Area" or "Drainage Basin".

---

$G$	Coefficient of Skew	feet
$g$	Acceleration due to gravity	ft/s <sup>2</sup>
$H$	Total head loss; Head loss; Depth of water; Wave height	feet
$h$	Stage or head; Height of curb opening inlet; Head	feet

$h_{\Delta}$	Bend head loss	feet
$H_1$	Average design wave height for highest 1%	feet
$H_{10}$	Average design wave height for highest 10%	feet
$h_{avg}$	Average head	feet
$H_b$	Bend head loss; Design wave height	feet
$H_D$	Average hydraulic depth	feet
$h_e$ or $H_E$	Entrance head loss	feet
$h_f$ or $H_f$	Friction loss; Friction head loss	feet
$H_g$	Grate losses	feet
$HGL_{ds}$	Elevation of the hydraulic grade line at downstream node	feet
$HGL_{us}$	Elevation of the hydraulic grade line at upstream node	feet
$H_j$	Junction losses	feet
$h_L$	Total head loss due to local minor and friction losses	feet
$H_L$	Total energy losses	feet
$h_m$	Minor head loss	feet
$h_{max}$	Maximum head	feet

$H_o$	Outlet or exit losses	feet
$h_o$	Hydraulic grade line height above outlet invert; Exit head loss; Summation of minor losses	feet
$h_s$	Depth of riprap basin	feet
$H_s$	Significant (design) wave height	feet
$H_v$	Velocity head	feet
HW	Headwater depth (subscript indicates section)	feet
$HW_i$	Headwater depth as a function of inlet control	feet
$HW_o$	Headwater depth above outlet invert	feet
$HW_{oi}$	Headwater depth as a function of outlet control	feet
$HW_r$	Headwater depth above roadway	feet
I	Inflow rate	cfs
i	Average Rainfall intensity; Rainfall intensity	in/hr
$I_1$	Inflow rate at time 1	cfs
$I_2$	Inflow rate at time 2	cfs
IA	Percentage of impervious area	%

$I_a$	Initial abstraction from total rainfall	inches
$K$	Channel conveyance; Statistical Method Frequency Factor; Anderson Method Coefficient of Imperviousness; Bend loss coefficient; Entrance loss coefficient; Exit loss coefficient	-
$K$	Conveyance of cross section	cfs
$K_e$	Entrance loss coefficient	-
$K_o$	Initial head loss coefficient	-
$K_o$	Conveyance of the gutter section beyond depression	cfs
$k_t$	Submergence coefficient	-
$K_w$	Conveyance of the depressed gutter section	cfs
$L$	Discharge-weighted or conveyance reach length; Length of culvert; Length of roadway crest; Flow Length or Length of Strip; Anderson Method Basin Length or Snyder Method Channel Length; Length of grate inlet; Length of curb opening; Length of pipe; Broad-crested weir length	feet
$l$	Length of mainstream to furthest divide	feet
$L'$	Equivalent length of channel	miles
$L_B$	Length of riprap basin	feet
$L_{ca}$	Length along main channel to a point opposite the watershed centroid	miles

$L_R$	Require length of inlet	feet
$L_S$	Length of dissipating pool	feet
$L_T$	Curb opening length for 100% interception	feet
$M$	Rank of a flood within a long record	-
$m$	Number of flow segments	-
$N$	Number of years of flood record	years
$n$	Manning's roughness coefficient	-
$O_1$	Outflow rate at time 1	cfs
$O_2$	Outflow rate at time 2	cfs
$P$	Precipitation	inches
$P$ and $P_w$	Wetted perimeter; Perimeter of grate opening	feet
$Q$	Statistical Method Mean of Logs	-
$Q$	Discharge; Total flow to inlet or flow in gutter	cfs
$Q$	SCS Direct Runoff	inches
$q$	Storm runoff during a time interval	inches
$Q, Q_p$	Maximum rate of runoff or Peak Discharge; Discharge or flow rate	cfs

$Q_{avg}$	Average flow rate	cfs
$Q_b$	Bypass flow	cfs
$Q_d$	Discharge through the culvert	cfs
$Q_i$	Peak inflow rate	cfs
$Q_L$	Mean of the logarithms of the peak annual floods	cfs
$Q_o$	Peak outflow rate	cfs
$q_o$	Allowable outflow rate	cfs
$Q_s$	Gutter capacity above the depressed section	cfs
$Q_t$	Design or check discharge at culvert	cfs
$Q_T$	Total flow	cfs
$Q_t$	Maximum allowable flow	cfs
$Q_w$	Flow in width W	cfs
R	Flood frequency ratio	-
R	Hydraulic radius (A/P)	feet
RC	Regression constant	-

$R_f$	Ratio of frontal flow intercepted to total flow	-
RI2	Rainfall intensity for the 2-hr, 2-yr occurrence	inches
RQ	Equivalent rural peak runoff rate	cfs
$RQ_T$	Rural Regression for Return Period T Peak Discharge	cfs
$R_s$	Ratio of side flow intercepted to total flow	-
S	Anderson Method Index of Basin Slope	ft/mi
S	SCS Method Potential maximum retention storage	inches
S	Slope of the energy grade line; Longitudinal slope of pavement or gutter slope	ft/ft
S	Storage volume	ft <sup>3</sup> , ac-ft.
S or Y	Ground slope	ft/ft or %
$S_1$	Storage volume at time 1	ft <sup>3</sup>
$S_2$	Storage volume at time 2	ft <sup>3</sup>
$S_A$	Average slope of the energy grade line	ft/ft
$S_e$	Equivalent cross slope	ft/ft
SF	Stability factor applied	-
$S_f$	Friction slope	ft/ft

$S_g$	Specific gravity of rock riprap	-
$S_{gr}$	Specific gravity of stone	-
$S_{gw}$	Specific gravity of water	-
SL	Urban Regression Method Main Channel Slope	ft/mi
$S_L$	Standard Deviation	-
$S_o$	Channel slope; Slope of Culvert	ft/ft
SP	Storage parameter (Pagan Method)	-
ST	Basin storage factor	%
STO	Maximum storage volume (Pagan Method)	-
$S_w$	Depression section slope or gutter cross slope; Gutter cross slope including local depression	ft/ft
$S_x$	Cross Slope	ft/ft
$\Delta t$	Routing time period (timestep)	seconds
T	Anderson Method Lag Time	hours
T	Top width at the water surface; Spread	feet
$T_b, t_b$	Time base on hydrograph	hours, minutes

$T_c, t_c$	Time of concentration; Modified Critical Storm Duration	minutes
$T_d$	Critical storm duration	minutes
$T_i$	Duration of basin inflow	hours, minutes
$\tau_{max}$	Maximum tractive force	lbs/ft <sup>2</sup>
$\tau_o$	Average tractive force	lbs/ft <sup>2</sup>
$T_p$	Time to Peak	minutes
$\tau_p$	Permissible shear stress	lbs/ft <sup>2</sup>
$T_r$	Time to Recede	minutes
$\tau_s$	Side slope shear stress	lbs/ft <sup>2</sup>
$T_s$	Spread over depressed section	feet
$T_t$	Travel time	hours
TW	Tailwater depth above invert of culvert	feet
UQ	Urban Regression Method peak runoff rate	cfs
$UQ_T$	Peak runoff rate for Urban Watershed for Return Period T	cfs
V	Mean velocity; Average velocity of flow; Velocity of flow in gutter	fps
V	Storage volume	

		ft <sup>3</sup> , ac-ft.
V <sub>a</sub>	Average velocity in main channel	fps
V <sub>B</sub>	Average velocity at riprap basin overflow	fps
V <sub>ce</sub>	Channel erosion control volume	ft <sup>3</sup> , ac-ft.
V <sub>d</sub>	Average velocity in downstream channel	fps
V <sub>L</sub>	Average velocity at length (L) downstream from brink	fps
V <sub>o</sub>	Average velocity of flow at culvert outlet; Gutter velocity where splash-over first occurs	fps
V <sub>s</sub>	Storage volume estimate	ft <sup>3</sup> , ac-ft.
V <sub>u</sub>	Average velocity in upstream channel	fps
V <sub>w</sub>	Wave velocity	fps
W	Drainage area width; Width of depression; Width of gutter pan; Width of grate	feet
W	Minimum weight of outside stones for no damage	tons
W <sub>50</sub>	Weight of the 50% size stone	lbs.
W <sub>B</sub>	Width of riprap basin at overflow	feet
W <sub>o</sub>	Width dimension of culvert shape	feet
WQV	Water quality volume	ft <sup>3</sup>

X	Logarithm of the annual peak	-
y	Depth of flow in approach gutter	feet
Z	T/d, reciprocal of the cross slope	-
z	Elevation head	feet
$\alpha$	Velocity distribution coefficient	-
$\alpha$	Angle of face slope from the horizontal	degrees
$\theta$	Side slope angle; Angle with respect to centerline of outlet pipe; Angle of embankment with respect to the horizontal	degrees
$\rho$	70° for randomly placed rubble	degrees
$\phi$	Angle of repose of material	degrees
$\gamma$	Unit weight of water	lbs/ft <sup>3</sup>
