ROUTE NUMBERING IN VIRGINIA

INTERSTATE ROUTES

Routes that run west and east are assigned even numbers of two digits. Examples are Route I-64 and I-66.

Routes that run south and north are assigned odd numbers of two digits. Examples are Route I-81 and Route I-95.

Full or partial circumferential routes are assigned three digit numbers. The first digit is an even number with the other two numbers being the main Route number. Examples are Routes I-264, I-295, I-495 and I-664.

Spur routes are assigned three digit numbers. The first digit is an odd number with the other two digits being the main Route number. Examples are Route I-381 and Route I-581.

U.S. ROUTES

U.S. Routes constitute a part of the Primary System of Highways. The method for numbering is similar to the numbering of Interstate Routes. Routes that run west and east are assigned even numbers and those that run south and north are assigned odd numbers. Examples of west and east routes are U.S. Route 60 and U.S. Route 360, examples of south and north routes are U.S. Route 1 and U.S. Route 17.

There are some exceptions as some route number designations do not adhere to the method of numbering. Notable examples include U.S. Route 211 which runs west and east and U.S. Route 522 which runs south and north.

STATE ROUTES

Routes within the Primary System are numbered from 1 through 599 statewide and roads within the Secondary System are numbered 600 and above countywide. There is no relationship between route numbers and the direction of the routes.

An exception is Interstate Route Number 664, this number would normally designate a State Secondary Route; however, it is assigned to an Interstate Route.
